Section 4

Multiplant Action Descriptions for Active Issues

Multiplant Action Number: A-01

Title: 10 CFR 50.55a(g) ISI

Lead Project Manager: R. Cilimberg

Priority: 1

Technical Review Branch(es): MTEB

Statement of Problem:

Licensees for boiling or pressurized water-cooled nuclear power facilities are required by 10 CFR 50.59a(g) to have an inservice inspection program that meets the requirements of Section XI of the ASME Boiler and Pressure Vessel Code and Addenda (The Code). If the licensee determines that it is impractical to meet certain requirements of the Code, justification must be provided to the Commission, which can grant relief from specific Code requirements or impose alternate requirements.

Background:

Staff review is currently several years behind originally planned schedules. The staff has previously given interim implementation guidance to the licensees by letter. In general, this guidance authorized the licensees to implement their ISI plans as proposed pending completion of review by the staff. In some cases the period for which the proposed plans and interim implementation authorization would apply has expired and the licensees have made subsequent submittals before the staff completed review of the original plan.

Current Status:

The backlog of ISI relief requests is being reviewed by a contractor (SAI). After the current backlog is cleared, reviews of requests for relief from code requirements will be conducted on a plant specific basis with a schedule keyed to inspection program update requirements.

Actions Requred to Complete the MPA:

Thirty-nine facilities remain to be reviewed in FY-82 in accordance with the attached schedule. Thirty days beyond the scheduled due date is being allotted for the ORPM to complete action.

Status Updated: 7/15/82

Multi-Plant Action No. A-02

No. of Plants: 73

Title: Appendix A - ALARA

Priority: 1

Cognizant Assistant Director: T. M. Novak

Cognizant Branch Chief: J. F. Stolz

Lead Engineer: P. C. Wagner

Lead Technical Review Branch Effluent Treatment Systems Branch

Other Review Branches: Radiological Assessment Branch

Problem:

Implementation of Technical Specifications called for in 50.36a and Appendix I to 10 CFR 50.

Background:

Appendix I was published in 1975 and Model TS were sent to all licensees on 7/78, 11/78 and 7/79. Submittals have been received from all licensees except Kewaunee.

Current Status:

Action completed on 4 plants (Farley 2, Sequoyah, McGuire and TMI-1). Site visits are being conducted to discuss RETs implementation. No TERs or SERs have been received, from either FRC or EG&G both of whom have been contacted for these reviews

Action(s) Required to Complete the Licensing Action:

1. Contractor and NRR visits to each site to discuss RETs implementation.
2. Contractor provide NRR with updated SERs and negotiated TS.
3. DL issue license amendment.

Status Updated: 6/16/82

Multiplant Action Number: A-04

Title: Containment Leak Testing - Appendix J

Lead Project Manager: W. Paulson

Priority: 1

Technical Review Branch(es): CSB

Contractor: Franklin Research Institute

Statement of Problem:

Some operating plants may not be in full compliance with Appendix J to 10 CFR Part 50.

Background:

Appendix J to 10 CFR Part 50 was published after many nuclear power plants had either received their operating license or their containments had reached an advanced state of design of construction. Accordingly, some plants may not be in full compliance with Appendix J. Licensee submittals, including exemption requests and proposed Technical Specifications need to be reviewed.

Current Status:

Franklin Research Center is under contract for performing the review of the 47 remaining plants in this program. All (46) TERs have been received from Franklin Research Institute. No TER is expected for Dresden 1 which is on hold. Forty SERs have been forwarded to DL by CSB; three of these need further work. Nineteen licensing actions have been completed.

Actions Required to Complete the MPA:

ORPMs are working on 12 SERs in preparation for issuance. CSB needs to complete 6 SERs plus rework 3 SERs.

Status Updated: ____________

Multiplant Action Number A-10

Title Contingency Planning

Lead Project Manager E. McPeek

Priority High

Technical Review Branch(es)

(Primary) Power Reactor Safeguards Licensing Branch, NMSS

(Secondary) Standardization and Special Projects Branch, NRR

Statement of Problem:

Development of a plan to specify for licensee personnel specific objectives which they must achieve to detect and deter threats, thefts or radiological sabotage for all NRC licensed commercial power reactors.

Background:

NRC Rules, as stated in 10 CFR Parts 50 and 73, require each utility licensed by the NRC to operate a commercial power reactor to submit for NRC approval and to implement a safeguards contingency plan.

Current Status:

1. Acceptance criteria have been developed and are stated in the following:

    a. 10 CFR Part 73, Appendix C
    b. Regulatory Guide 5.44
    c. Review Guideline 24

2. The Power Reactor Safeguards Licensing Branch, NMSS has the lead responsibility for reviewing the plans from a safeguards viewpoint.. The Standardization and Special Projects Branch has the lead responsibility for reviewing the plans from a plant safety viewpoint.

3. No contractors are utilized in this licensing review.

Action Required to Complete the MPA:

1. For operating power reactors all plans have been reviewed and four (4) remain to be approved. The NMSS staff has provided, through the appropriate NRR Project Manager, specific comments for consideration and action by the licensees. Once these issues are resolved, license amendments will be issued.

2. For applicants for operating licenses, the NMSS staff has taken review actions designed to complete the review and acceptance of each plan prior to the target date of the issuance of the SER.

Status Updated: 4/16/82

Multiplant Action Number: A-11

Title: Guard Training PLans

Lead Project Manager: E. McPeek

Priority: High

Technical Review Branch(es)

(Primary) Power Reactor Safeguards Licensing Branch, NMSS

(Secondary) Standardization and Special Projects Branch, NRR

Statement of Problem:

Development of a plan to specify an acceptable level of training to be provided to the licensee's security force for implementation at all NRC licensed commercial power reactors.

Background:

NRC Rules, as stated in 10 CFR Parts 50 and 73, require each entity licensed by the NRC to operate a commercial power reactor to submit for NRC approval and to implement a security force training and qualification plan.

Current Status:

1. Acceptance criteria have been developed and are stated in the following:

   a. 10 CFR Part 73, Appendix B
   b. NUREG-0674
   c. NUREG-0219
   d. NUREG-0576

2. The Power Reactor Safeguards Licensing Branch, NMSS has the lead responsibility for reviewing the plans from a safeguards viewpoint. The Standardization and Special Projects Branch, NRR has the lead responsibility for reviewing the plans from a plant safety viewpoint.

3. No contractors are utilized in this licensing review.

Actions Required to Complete the MPA:

1. For operating power reactors all plans have been reviewed and ten (10) remain to be approved. The NMSS staff, through the appropriate NRR Project Manager, has provided specific comments for consideration and action by the licensees. Once these issues are resolved license amendments will be issued..
2. For applicants for operating licenses, the NMSS staff has taken review actions designed to complete the review and acceptance of each plan prior to the target date of the issuance of the SER.

Status Updated: 4/16/82

Multiplant Action Number: A-14

Title: 10 CFR 50.55a(g) Inservice Testing

Lead Project Manager: R. Cilimberg

Priority: 1

Technical Review Branch(es): MEB

Statement of Problem:

Licensees for boiling or pressurized water-cooled nuclear power facilities are required by 10 CFR 50.55a(g) to have an inservice testing program that meets the requirements of Section XI of the ASME Boiler and Pressure Vessel Code and Addenda (The Code). If the licensee determines that it is impractical to meet certain requirements of the Code, justification must be provided to the Commission, which can grant relief from specific Code requirements or impose alternate requirements.

Background:

Staff review is currently several years behind originally planned schedules. The staff has previously given interim implementation guidance to the licensees by letter. In general, this guidance authorized the licensees to implement their IST plans as proposed pending completion of review by the staff. In some cases the period for which the proposed plans and interim implementation authorization would apply has expired and the licensees have made subsequent submittals before the staff completed review of the original plan.

Current Status:

The backlog of IST relief requests is being reviewed by ORPMs, MEB and a contractor (EG&G). After the current backlog is cleared, reviews of requests for relief from Code requirements will be conducted on a plant specific basis with a schedule keyed to testing program update requirements. Twenty-six of the backlog facilities will be reviewed by the regions initially with more to follow in the future.

Actions Required to Complete the MPA:

Sixty-four facilities remain to be reviewed in FY-82 in accordance with the attached schedule. For the reviews being conducted by MTEB or the contractor, thirty days beyond the scheduled due date is being allotted for the ORPM to complete action.

Status Updated: 7/15/82

Multi-Plant Action No. A-16

Title: Qualification of Inspection, Examination, Testing and Audit Personnel

Lead Project Manager: Dave H. Jaffe

Priority; I

Technical Review Branch: QAB

Statement of Problem:

Guidance for the qualification requirements for inspection, examination, testing, and audit personnel has been incorporated in Regulatory Guides 1.58, Revision 1, and 1.146. This guidance should be implemented in a uniform manner by all power reactor licensees.

Background:

On May 4, 1981 Generic Letter 81-01 was sent to power reactor licensees and CP holders to request commitments to comply with certain regulatory positions presented in the subject Regulatory Guides.

Current Status:

All operating reactor licensees have responded to Generic Letter 81-01 and these responses are under review in QAB against the criteria of Regulatory Guide 1. 146 and Positions C.5, 6, 7, 8, and 10 of Regulatory Guide 1.58 Revision 1. As of June 15, 1982, MPA-A-16 has been resolved for 50 of the 72 scheduled facility reviews.

Action(s) Required to Complete the Licensing Action:

A close out letter is to be sent to licensees who provided an acceptable commitment to Regulatory Guides 1.58, Revision 1, and 1.146. As of June 15, 1982 letters have been sent closing out 50 of the 72 scheduled reviews.

Status Updated June 17, 1982

Multiplant Action No: B-01

Title: Diesel Generator Lockout

Lead Project Manager: T. Wambach

Priority:

Technical Review Branch(es): ORAB

Problem:

Some failures-to-start of diesel generators have been attributed to diesel generator lock-out involving critical timing of control circuit relay operation or reset following manual shutdown of the diesel. IE has transferred responsibility to Licensing to determine whether similar circuitry problems exist at other facilities and what corrective measures should be implemented.

Background:

By memo dated 1/26/77, DOT has requested that a survey be made of all operating plants to determine whether lockout or diesel generator operability is specifically annunciated in the control room for each diesel generator. A letter was sent to all operating reactors in March 1977. Review of responses has been completed.

Current Status:

Of the 63 units, 59 have been completed. NRC technical position has been documented to DL by ORAB.

Action(s) Required to Complete the Licensing Action:

Forward position to licensees of 4 remaining units. Obtain licensee commitment to meet position and write final letter closing out. The remaining 4 units are: Browns Ferry 1, 2, 3 and Davis-Besse.

Status Updated: June 16, 1982

Multi-Plant Action No. B-04

No. of Plants: 37

Title: Reactor Vessel Overpressure Protection

Priority: 2

Cognizant Assistant Director: T. M. Novak

Cognizant Branch Chief: J. F. Stolz

Lead Engineer: A. W. DeAgazio

Lead Technical Review Branch RSB*

Other Review Branches:

Problem:
Prevent overpressurizing the reactor vessel when at low temperature. Applicable to PWRs only.

Background:
A number of events have demonstrated that administrative controls alone are not adequate to prevent low-temperature overpressure events at PWRs. All PWRs were requested to provide an overpressure protection system that is to be used when the plant is in a low-temperature shutdown condition.

Current Status:
All plants implemented their system with preliminary NRC approval followed by post implementation review of (a) electrical aspects; (b) reactor system aspects; (c) Technical Specifications. Twelve plants remain for which licensing action is required. SERs are available for three of the plants with only PM processing required. The remaining nine plants are being reviewed by contract with EG&G for reactor system aspects through RSB. Previous contracts through ORAB have generated TERs for electrical aspects.

Actions Required to Complete the MPA:

Complete SERs for the nine plants. Review Tech Specs by PM and lead PM. Issue Tech Specs and SERs for remaining plants.

Status Updated: 6/16/82

---

*ORPMs responsible for integrating existing electrical, instrument and control TER with RSB's review.

Multiplant Action Number: B-05 (USI A-42)

Title: Stress Corrosion Cracking - Implementation of NUREG-0313, Rev. 1

Lead Project Manager: Dick Clark

Priority: High

Technical Review Branches: ORAB, MTEB

Statement of Problem:

Leaks and cracks in the heat-affected zones (HAZs) of welds in BWR austenitic stainless steel piping and components have been observed since the mid-1960's. All the cracks have been attributed to intergranular stress corrosion cracking (IGSCC). The revised purpose of this task is to insure that all BWRs have adequate programs--as defined in NUREG-0313, Rev. 1--to: (1) design systems constituting the reactor coolant system pressure boundry (RCSPB) to minimize the potential for IGSCC, (2) select materials for the RCSPB resistant to IGSCC, (3) control the water chemistry environment so as to reduce the potential for intergranular corrosion, (4) detect potential cracking through augmented inspections before it develops into a through-wall leak, and (5) detect possible RCSPB leakage before it becomes significant.

Background:

In 1975 NRC (AEC) formed a Pipe Cracking Study Group (PCSG) to investigate the cause of cracking in BWR piping. In July 1977 the staff issued an implementation document, NUREG-0313, based on recommendations of the PCSG. As a result of cracking in large diameter pipes and in nozzles which had not been observed prior to 1975, a new PCSG was activated in September 1978. In October 1979 Revision 1 to NUREG-0313 was issued for comment; this contained the latest recommendations of the Study Group. Based on industry comments, the document was modified and reissued. In view of the revised staff acceptance criteria, the previous reviews were terminated (TACs 08207 through 08230 plus 11263). New TACs have subsequently been issued (TACs 46651-46674) to cover the revised review effort.

Current Status:

In February 1981 NUREG-0313, Rev. 1 was issued to all holders of BWR operating licenses or construction permits and to all applicants for operating licenses. By July 1, 1981 the applicants/licensees were to provide their program for replacement of service sensitive lines and welds, their program for augmented inservice inspection, their program for improving the water chemistry environment and incorporation of adequate leak detection capability. Initial responses were received from all but one licensee and from all near-term applicants for operating licenses.

Multiplant Action Number - B-05 (USI A-42) cont'd

Actions Required to Complete the Licensing Action:

Review of individual applicant and licensee responses to determine if they meet the guidelines published in NUREG-0313, Rev. 1. Since MTEB could not begin the reviews this fiscal year, the reviews are being performed by INEL/EG&G. A revised statement of work, including MPA B-05, was mailed to the contractor on March 8, 1982. INEL has submitted a revised 189. Priority is being given to completing the reviews on those BWRs with furnace sensitized safe ends. A total of 23 reviews need to be completed for operating reactors, all of which are scheduled for completion in FY83.

Status Updated: June 17, 1982

Multi-Plant Action No. B-17

No. of Plants: 60

Title: Tech Spec Surveillance for Hydraulic Snubbers

Priority: 1

Cognizant Assistant Director: T. M. Novak

Cognizant Branch Chief: R. A. Clark

Lead Engineer: Leon B. Engle, ORB #3

Lead Technical Review Branch ORAB

Other Review Branches:

Problem: Operability of snubbers for LWRs is required to provide assurance that the structural integrity of the reactor coolant system and all other related systems is maintained during and following a seismic or other event initiating dynamic loads. OPERABILITY is verified by an Inservice Inspection and Testing Surveillance program specified in plant Technical Specifications (TS). Recent operating experience has indicated the need for changes, clarifications and improvements in the Inservice Surveillance Requirements for hydraulic snubbers.

Background:
By letter dated November 20, 1981, the NRC requested that all power reactor licensee's (except SEP) incorporate the model NRC TS in plant specific Appendix A TS. A similar request was sent to SEP operating licensees on March 23, 1981. The NRC TS require that the visual inspection frequency be based upon maintaining a constant level of snubber protection to systems. In order to provide assurance of hydraulic snubber functional reliability, a representative sampling of plant installed snubbers must be functionally tested during plant shutdowns at 18 month intervals. The required sampling provides a confidence level of 95% that 90% to 100% of plant specific snubbers will be OPERABLE within acceptance limits.

Current Status:
1) Resolution of this action requires the issuance of an Operating License Amendment except in those cases where a given facility does not utilize hydraulic snubbers.
2) The FY82 Operating Plan requires the completion of 25 B-17 actions.
3) A total of 33 actions have been completed to date:

Actions Required to Complete the MPA:
1) 30 actions have been completed to date for FY82.
2) 0 additional actions required to meet FY82 schedule.

Status Updated: 6/17/82

Multi-Plant Action No. B-22

No. of Plants: 66

Title: Tech Spec Surveillance for Mechanical Snubbers

Priority: 1

Cognizant Assistant Director: T. M. Novak

Cognizant Branch Chief: R. A. Clark

Lead Engineer: Leon B. Engle, ORB #3

Lead Technical Review Branch ORAB

Other Review Branches:

Problem:

OPERABILITY of snubbers for LWRs is required to provide assurance that the structural integrity of the reactor coolant system and all other related systems is maintained during and following a seismic or other event initiating dynamic loads. Operability is verified by an Inservice Inspection and Testing Surveillance program specified in plant Technical Specifications (TS). Prior to initiation of MB-22, mechanical snubbers had not been included in operating plant surveillance programs. Recent operating experience has indicated that mechanical snubbers require OPERABILITY requirements similar to those required for hydraulic snubbers.

Background:

By letter dated November 20, 1981, the NRC requested that all power reactor licensee's (except SEP) incorporate the model NRC TS for mechanical snubbers in plant specific Appendix A TS. A similar request was sent to SEP operating licensees on March 23, 1981. The NRC TS require that the visual inspection frequency be based upon maintaining a constant level of snubber protection to systems. In order to provide assurance of mechanical snubber functional reliability, a representative sampling of plant installed snubbers must be functionally tested during plant shutdowns at 18 month intervals. The required sampling provides a confidence level of 95% that 90% to 100% of plant specific snubbers will be OPERABLE within acceptance limits.

Current Status:

1) Resolution of this action requires the issuance of an Operating License Amendment except in those cases where a given facility does not utilize mechanical snubbers.
2) The FY82 Operating Plan requires the completion of 25 B-22 actions.
3) A total of 41 Actions have been completed to date.

Actions Required to Complete the MPA:

1) 24 actions have been completed to date for FY82.
2) 1 additional action required to meet FY82 schedule.

Status Updated: 6/17/82

Multiplant Action Number: B-23

Title: Potential Equipment Failures Associated with Degraded Grid Voltage

Lead Project Manager: R Dudley

Priority:

Technical Review Branch(es): Power Systems Branch

Statement of the Problem:

Potential exists for supplying safety and non-safety equipment with voltage outside the range for which it was designed for longer than transient periods. Such conditions could result in safety-related equipment being unavailable to mitigate the consequences of an accident.

Background:

On July 20, 1976, Northeast Nuclear Energy Company (NNECo) reported that, following a trip of Millstone Unit No. 2 on July 5, 1976, several motors powered from 480 volt (v) motor control centers failed to start as required. The failure of the 480 v motors to start was traced to blown control power fuses on the individual motor controllers. These controllers received control power through 480 v/120 v transformers within the controller.

NNECo's investigation disclosed that, as a result of the plant trip, the grid voltage dropped from 352 kv to 333 kv. This voltage drop, in conjunction with additional voltage drops associated with the transformers involved, reduced the control power and voltage within individual 480 v controllers to a voltage which was insufficient to actuate the main line controller contractors. As a result, when the motors were signalled to start, the control power fuses were blown. Subsequent testing by NNECo showed that the contractors required at least 410 v to function properly.

NNECo concluded that under similar low voltage conditions, the operability of 480 v Engineered Safety Feature equipment could not be assured.

NNECo's immediate corrective action was to raise the setpoint of the Engineered Safeguards Actuation System (ESAS) "loss of power" under-voltage relays to assure that the plant would be separated from the grid and that emergency power system (dual) operation would be initiated before the control voltage fell below that required for contractor operation. A trip of the under-voltage relays causes the emergency buses to be de-energized and a load shed signal to strip the emergency buses, the diesel generators to start and power the emergency buses, and required safety related loads to sequence start on the buses.

Background (Cont'd)

On July 21, 1976, NNECo reported that the earlier corrective action taken was no longer considered appropriate because during starting of a circulating water pump, the voltage dropped below the new ESAS undervoltage relay setting. This de-energized the emergency buses, caused load shedding to occur, started the diesel generators and began sequencing loads onto the emergency buses in accordance with the design. However, during sequencing of the loads onto the buses, the voltage again dropped below the undervoltage relay setting which caused the load shed signal to strip the buses. The result was energized emergency buses with no loads supplied.

Current Status:

All utilities operating plants (BWR, PWR, HTGR) licensed prior to 1976 must provide under-voltage relays which separate the plant from the grid (in case of degraded grid voltage) and activate the plant emergency power system. The current DL schedule requires this item to be completed in FY-1982. Technical review is provided by the Power Systems Branch, with contractor technical support from Lawrence Livermore Lab and EG&G.

67 - operating plants covered by B-23
56 - SERs completed (7 of which have open items)
45 - Licensing Actions completed

Actions Required to Complete the MPA:

Complete the 11 remaining SERs. Complete the 22 remaining licensing actions.

Status Updated: June 17, 1982

Multi-Plant Action No B-24*
*B-20 integrated into B-24 on 8/25/80

No. of Plants: 66

Title: Venting and Purging Containment While at Full Power and Effect of LOCA

Priority: High

Cognizant Assistant Director: T. Novak

Cognizant Branch Chief: S. Varga

Lead Engineer: E. Reeves

Lead Technical Review Branch: CSB/DSI

Other Review Branches: EQB/DE, ORAB/DL & AEB/DSI

Problem:

Purging and/or venting of reactor containment buildings with reactor coolant temperature above 200°F may result in LOCA site boundary doses exceeding 10 CFR 50 Part 100 limits.

Background:

Events at Millstone 1 and Salem 1 (where the automatic high radiation closure of purge valves was overridden by operators) resulted in a generic letter being sent to all licensees of operating reactors in November 1978. A report was also made to Congress (#78-05). NRC advised of the events, requested licensees take action to minimize purge and vent operations, and requested response to SRP 6.2.4 and CSB BTP 6-4. In October 1979 an Interim Position was developed by the staff and licensees were requested to conform to it pending completion of our long-term review. In August 1980 generic item B-20 Leakage of Resilient Seals for purge and vent valves was integrated into the B-24 issue. A staff position to require Technical Specifications (as a leakage surveillance at either 3-months or 6-months intervals depending on valve usage) was developed and is included in the guidance being provided to licensees as specific plant reviews progress.

Current Status:

1. All licensees have responded to the November 1979 request for information. Reviews of licensee submittals are still underway although TMI-2 and the April 1980 reorganization of NRR caused delays. All licensee's responses to the October 1979 Interim Position have been reviewed and found acceptable as an interim measure. IE is monitoring licensees for continued compliance with these interim commitments.

2. The Lead Project Manager has issued guidance in memoranda dated August 25, 1980 and March 24, 1981 to all OL OR Branch Chiefs and Project Managers and to the Technical Review Team. The August 25, 1980 memorandum identified the new TACS, the reviewers and assignments to assure continuation of reviews during the NRR reorganization period after April 1980. Later status and guidance is described in item 4 below.

3. Contracts are managed by the Technical Review Team as follows:

   a. Electrical Reviews are managed by ORAB/DL with contracts to EG&G, Inc., Idaho and LLNL San Ramon, and FRC, Philadelphia. SEP reviews are managed by SEP with contract to EG&G Idaho.

   b. Valve operability reviews are managed by EQB/DE with contract to BNL.

   c. CSB 6-4 Review requirements are managed by CSB/DSI with contract to LLNL.

   d. Radiological Impact Reviews are managed by AEB/DSI with contract to EXXON Nuclear Idaho Company, Inc.

4. As of June 8, 1981, a sample letter prepared by ORB #1 (concurred in by CSB/DSI) was prepared for issuance to each licensee with the next NRC action letter (either Q's or SER). The sample letter (provided in Lead PM Memorandum dated June 19, 1981 to all Project Managers) contains the NRC position clarifications and sample Technical Specifications to close out the long-term reviews. The overall B-24 review will complete TMI Item II.E.4.2, except for II.E.4.2.5 Containment Pressure Setpoint. However, CSB/DSI will provide SER's for II.E.4.2.6 and II.E.4.2.7 or will concur in SER's developed by Project Managers

Actions Required to Complete B-24 and B-20 Licensing Actions:

1. Project Managers should issue the update status of NRC reviews as soon as possible to each licensee using the sample letter (4 above). This is important to get the issue clearly understood by each PM and each licensee and to get the action completed. Lead PM records show that sixteen (16) plants have not been sent the status letter per the June 19, 1981 instructions. This letter should contain the staff guidance and any existing staff SER's received to date.

2. CSB, EQB, AEB and ORAB should complete any remaining plant specific SER's and provide to Project Manager. Technical reviewers should also provide a status report to the Lead PM on TER's and SER's on a monthly basis.

3. Project Managers should review the licensee Technical Specification submittals and issue license amendments as required. Consult with Lead PM if problems occur.

4. TMI Item II.E.4.2.5 reviews by CSB have been completed. SER's have been issued to licensees except for Crystal River 3 and Palisades. Project Managers should complete this action.

Status Update: 4/15/82

Multiplant Action Number: B-25

Title: Feedwater and CRD Nozzle Cracking

Lead Project Manager: P. W. O'Connor

Statement of Problem:

BWR feedwater nozzles and control rod drive nozzles have developed cracks due to thermal fatigue.

Background:

The generic issue has been resolved by the 11/13/80 issuance of NUREG-0619 which provided licensees of BWRs with acceptable methods to resolve the issue on a plant-by-plant basis.

Current Status:

Thirteen plants have committed to follow the staff's guidance and have received letters confirming that their proposed action is acceptable. The licensing action is complete on these plants. Each will submit a post-implementation report following completion of their proposed modification.

Ten plants are being reviewed to resolve deviations from NUREG-0619 guidance. Additional information and/or commitments are required from these plants to permit the staff to issue a confirmatory action letter or a show cause order to require compliance with staff requirements.

Actions Required to Complete the MPA:

Complete the review of the deviations on the eleven remaining plants. Obtain commitments to follow NUREG-0619 guidance or issue orders requiring compliance if necessary.

Status Updated: June 18, 1982

Multiplant Action Number: B-41

Title: Fire Protection - Final Tech Specs - Final SER Supplements

Priority: High

Lead Project Manager: T. Wambach

Review Branches: CEB, ASB, PSB, ICSB, RSB, PTRB, LQB

Statement of Problem:

Protection of safe, shutdown capability from the adverse effects of fire in any area of the plant. During the OL review of plants licensed prior to July 1976, no in-depth review was performed in this area.

Background:

Fire at Browns Ferry Nuclear Plant in March 1975 disabled redundant safety divisions and normal safe shutdown equipment. NUREG-0050.

Current Status:

10 CFR 50.48 and Appendix R to 10 CFR 50 became effective February 17, 1981. The licensees for 71 units licensed prior to January 1, 1979 and for 3 units licensed after January 1, 1979 are making submittals describing (1) plans and schedules to meet Appendix R, (2) design descriptions of alternative, safe shutdown modifications, and (3) exemption requests from Appendix R by July 1, 1982.

Action(s) Required to Complete the Licensing Action:

The submittals described above for all 74 units must be reviewed and acted upon by January 1, 1983. This will entail issuing exemptions, exemption denials and SERs approving alternative or dedicated safe shutdown modifications. Review of new OLs is now incorporated in the SRP. Final Tech Specs covering the equipment added as a result of Appendix R must also be issued after the modifications are complete.

Status Updated: June 16, 1982

Multiplant Action Number: B-48

Title: Adequacy of Station Electric Distribution Voltage

Leak Project Manager: R. Dudley

Priority: 2

Technical Review Branch(es): PSB

Statement of Problem:

This review is intended to determine if the onsite distribution system in conjunction with the offsite power sources has sufficient capacity and capability to automatically start and operate all required safety loads within the equipment voltage rating.

Background:

At Arkansas Nuclear 1, loss of offsite power indicated that the electric distribution systems were inadequate for two unit operation. All utilities were asked to review their distribution systems to see if voltages were adequate.

Current Status:

69 - operating plants covered by B-48
45 - SER's completed (10 of which have open items)
29 - Licensing Actions completed

Actions Required to Complete the MPA:

Complete the remaining 36 SER's.
Complete the remaining 40 licensing actions.

Status Updated: June 4, 1982

Multi-Plant Action No. B-57

No. of Plants: 44

Title: Decay Heat Removal Capability

Priority: 2

Cognizant Assistant Director: T. M. Novak

Cognizant Branch Chief: J. F. Stolz

Lead Engineer: A. DeAgazio

Lead Technical Review Branch None

Other Review Branches:

Problem:
To assure redundancy in decay heat removal capability by incorporation of requirements into the Technical Specification.

Background:

Various events at PWRs that have occurred during shutdown conditions have indicated that administrative controls to assure decay heat removal capability have been inadequate. All PWR licensees were requested (in a letter dated June 11, 1980) to incorporate requirements for redundancy into their TSs.

Current Status:

Acceptance criteria are: (1) redundancy in decay heat removal capability must be provided for all modes or temperature ranges of operation, particularly in Modes 4, 5 and 6, and (2) adequate surveillance requirements must be provided. A total of 16 plants remain to be reviewed. Indian Point 2 and 3 have not responded to our original request.

INEL is reviewing submittals and identifying where the proposed TSs, in conjunction with existing TSs, do not conform with our Standard TSs.

Actions Remaining:
1) Review applicable sections of the Kewaunee, Crystal River 3 and Palisades Technical Specifications
2) Review TER's as they are completed. Decide whether deficiencies are serious enough to warrant additional requests to licensees. If not, issue the license amendment as requested.

Status Updated: 6/16/82

Multiplant Action No. B-58a

No. of Plants: All BWRs

Title: BWR Scram Discharge Volume Technical Specifications

Lead Project Manager: K. Eccleston

Priority: High

Technical Review Branch: ORB#2

Statement of Problem:

Common cause failures of instrument volume level switches. Precursors at Hatch and Brunswick resulted in IE Bulletin 80-14.

Background:

Model Technical Specifications were sent to the industry by letter dated July 7, 1980. Submittals were subsequently received from the affected licensees and are being reviewed by the Franklin Research Center.

Current Status:

NRC contract NRC-03-81-130 has been issued to Franklin Research Center to review licensee submittals and write TERs. Final TERs for 18 plants have been received as of 6/15/82.

Action Required to Complete the MPA:

Issue license amendments upgrading TS after receipt of TERs.

Status updated: June 16, 1982

Multiplant Action No. B-58b

No. of Plants: All BWRs (except LACBWR) - 23

Title: BWR Scram Discharge Volume Long Term Modifications

Lead Project Manager: K. Eccleston

Priority: High

Technical Review Branch: ASB

Statement of Problem:

Concerns raised as a result of the partial failure to scram event at Browns Ferry 3 on June 28, 1980 were documented in the staff's Safety Evaluation Report on the BWR Scram Discharge System dated December 1, 1980. A letter was issued on October 1, 1980 requesting a commitment to conform with revised criteria.

Background:

A letter dated December 9, 1980 forwarded the staff's generic SER with revised criteria. A letter dated March 30, 1981 provided clarification of the requirement for diverse instrumentation.

Current Status:

OMB clearance has been received and orders will be issued in near future.

Actions Required to Complete the MPA:

Obtain acceptable responses and commitment dates. Issue orders with model Technical Specifications. Issue NRC contract to FRC to perform post-implementation verification.

Status updated: June 16, 1982

Multi-Plant Action No. B-59

No. of Plants: 70

Title: Masonry Wall Design

Priority: 2

Cognizant Assistant Director: T. M. Novak

Cognizant Branch Chief: R. A. Clark

Lead Engineer: Charles Trammell

Lead Technical Review Branch SEB, SEPB

Other Review Branches:

Problem:
Inadequate design criteria for masonry walls. Applies to all plants.

Background:
Problem was discovered at Trojan during reviews associated with IEB 79-02 (anchor bolts) and IEB 79-14 (As-built verification). A masonry wall was found which supported numerous safety-related pipes which was not adequate to resist seismic forces. This resulted in the issuance of IE Bulletin 80-11 on May 8, 1980. NRR (SEB) has been assigned the responsibility to review licensee's responses to this Bulletin.

Current Status:
Franklin Research Center has been contracted to review most licensee submittals (exceptions: Trojan, Cooper. Dresden 1, Humboldt Bay, LaCrosse, Yankee-Rowe, San Onofre 1). Trojan and San Onofre 1 are being reviewed by SEB. LaCrosse and Yankee-Rowe will be reviewed by SEPB. Dresden 1 and Humboldt Bay are currently in a shutdown status, and will be reviewed by SEB if/when needed. Cooper has no safety-related masonry walls covered by IEB 80-11. Close-out letter for Cooper has been issued (2/17/82). Review schedule and acceptance criteria for review have been established.

Actions Required to Complete the MPA:
67 plants remain to be completed. Three finished to date. FRC review is active.

Status Updated: June 17, 1982

Multiplant Action Number: B-60

Title: Environmental Qualification of Electric Equipment for
Nuclear Power Plants

Lead Project Manager: Jose A. Calvo

Priority: 1

Technical Review Branch: Equipment Qualification Branch

Statement of Problem: All plants are required to meet the Commission Memorandum and Order CLI 80-21 concerning 10 CFR 50, Appendix A, GDC 4.

Background: The issue originated from a 1977 petition from the Union of Concerned Scientists on fire protection and equipment qualification. The multiplant action arose from the Commission Memorandum and Order CLI 80-21. Technical resolution of acceptance criteria were produced from Unresolved Safety Issue A-24.

Current Status: Licensee submittals under review by Franklin Research Center. A proposed rule was issued for public comment on January 20, 1982. Comments were due on March 22, 1982 and are in the process of being evaluated.

Actions required to complete the MPA: Final SERs must be issued for all plants. The schedule for completion, contingent on the proposed rule, will be no later than November 30, 1985.

Status Updated: April 16, 1982

Multi-Plant Action No. B-62

No. of Plants: 70

Title: ESF Reset Control Design Difficiency IE Bulletin 80-06

Priority: 1

Cognizant Assistant Director: T. M. Novak

Cognizant Branch Chief: J. F. Stolz

Lead Engineer: Sydney Miner

Lead Technical Review Branch ICSB

Other Review Branches:

Problem:

Certain equipment would return to its normal mode following the reset of an ESF signal. This protective action of the affected systems could be compromised once the associated actuation signal is reset.

Background:

On March 13, 1980, the Office of Inspection and Enforcement issued Bulletin 80-06, "Engineered Safety Feature (ESF) Reset Controls," to address the concern that the use of reset pushbuttons alone could permit certain engineered safety feature systems components to revert to the normal state following safety system actuation. The bulletin specified actions to be taken by licensee to address these concerns. By Task Interface Agreement, ROI 80-15, the Office of Nuclear Reactor Regulation was assigned responsibility for evaluating the licensee's responses to the Bulletin.

Current Status:

1. Acceptance Criteria
   Unless an alternative is justified by the licensee and the justification is acceptable, upon reset of ESF signals all affected equipment shall remain in its emergency mode. If there is multiple sequencing, none of the reset actions shall cause the affected equipment to deviate from its emergency mode.
2. Important Schedule Considerations
   20 additional licensing actions are scheduled to be completed this year. All of the remaining 15 SERs are scheduled to be issued this year.
3. Identification and Role on the Contractors
   The detailed technical review of the licensees responses to I&E Bulletin 80-06 was performed by EG&G's Sam Ramon under DL's technical assistance contract with Lawrence Livermore National Laboratory.

Required to Complete MPA:

1. EG&G complete review and issue TER	0 actions
2. Review TER and issue SER	8 actions
3. Issue SER to licensees	14 actions

Status Updated: 7/15/82

Multiplant Action Number B-63

Title Emergency Procedures and Training for Station Blackout

Lead Project Manager Chris Nelson

Priority High

Technical Review Branch(es) ORB #3

Statement of Problem:

All plants are required to implement emergency procedures and training for station blackout events (loss of all onsite and offsite ac power)

Background:

ASLAB (ALAB-603) concluded that station blackout should be considered a design basis event for St. Lucie 2.

NRC staff currently assessing station blackout on a generic basis (USI A-44)

Station Blackout procedures and training determined advisable action prior to completing A-44.

Current Status:

Generic letter 81-04 sent 2-25-81 requesting all plants (except St. Lucie 1&2) implement emergency procedures and training.

All but three plants have indicated procedures and training will be implemented on an acceptable schedule.

Actions Required to Complete the MPA:

Letters must be sent to 2 plants requesting information

Response from one plant must be evaluated

Status Updated:

June 21, 1982

Multiplant Action No. B-65

No. of Plants: All BWRs (except LACBWR) - 23

Title: Safety Concerns Associated with Pipe Breaks in BWR Scram System

Lead Project Manager: K. Eccleston

Priority: High

Lead Technical Review Branch: ORAB

Other Review Branches: ASB, PTR, EQB, RAB, AEB, RRAB, CSB, RSB, ORB#2,
ICSB, OLB, SPE

Statement of Problem:

Assess the overall risk to long-term core cooling from postulated pipe break in Scram Discharge Volume; investigate the mitigation capability for the postulated event; establish generic recommendations for correcting any deficiencies identified.

Background:

Draft NUREG-0785 issued April 3, 1981 by AEOD described certain safety concerns associated with postulated pipe breaks in the BWR Scram System. NRC letter dated April 10, 1981 to all BWR licensees requested a generic evaluation of the concerns within 45 days and a plant specific review within 120 days. The generic evaluation was submitted by GE on behalf of the BWR owners by letter dated April 30, 1981.

Current Status:

NUREG-0803 was issued to BWR licensees and applicants on 8/31/81. Plant specific licensee responses to concerns identified in this NUREG are being evaluated.

Action Required to Complete the MPA:

Review licensee's plant specific responses to the guidance contained in NUREG-0803.

Status updated: June 16, 1982

Multiplant Action Number B-66

Title Natural Circulation Cooldown

Lead Project Manager Ken Heitner

Priority Medium

Technical Review Branch(es) RSB

Statement of Problem:

All PWRs must review plant cooldown on natural circulation to determine if voiding will occur in the reactor vessel.

Background:

St. Lucie Unit 1, while cooling down on natural circulation due to a component cooling water malfunction, developed a steam space in the upper head of the reactor vessel.

Core cooling was not lost however complex situation deemed on undesirable challenge to the operator.

Current Status:

Generic letter 81-21, issued May 5, 1981, requested:

1. demonstration that natural circulation cooldown by procedure should not result in reactor vessel voiding
2. verification that supplies of condensate grade aux feedwater are sufficient
3. aspects of training and procedures dealing with this subject

All licensees have responded

Westinghouse Owners Group Generic Report (OG-57) dated 4-20-81

Actions Required to Complete the MPA:

Review all responses as well as Generic Westinghouse Report

44 actions remain-none scheduled for FY82

Status Updated:

September 15, 1982

FORMAT FOR MPA STATUS SHEETS

Multiplant Action Number B-67

Title Pressurized Thermal Shock to Reactor Pressure Vessels

Lead Project Manager Guy S. Vissing

Priority 1

Technical Review Branch(es) ORAB, MTEB, RSB, CPB, PTRB, GIB, RRAB

Statement of Problem:

Concerns a possibility that in PWRs pressure vessels could be subjected to severe overcooling transients followed by repressurization which could threaten the integrity of the RPVs.

Background: Pressure vessel thermal shock has been considered for many years in the context of assuring integrity in the vessel when subjected to cold emergency core cooling water during a large LOCA. Based on fracture mechanics analyses verified by enforcements, it was concluded that a postulated flow would not propagate through the vessel wall during a large LOCA. As a result of operating experience it was subsequently recognized that there could be transients in PWRs in which the vessel could be subjected to severe overcooling (thermal shock) followed by repressurization. In these pressurized thermal shock (PTS) transients, vessels could be subjected to pressure stresses superimposed upon the thermal stresses resulting from the temperature differences across the vessel wall. By letter dated April 20, 1981, we requested the PWR Owners Groups to address this problem and the licensees of operating PWRs to provide a response.

On the basis of our review of the PWR Owners Groups' responses and the PWR licensees' responses to our letter of April 20, 1981, and on the basis of our independent analysis, we determined that all operating plants could survive a severe overcooling event for at least **another year of full power** operation. However, for plants where neutron irradiation has significantly reduced the fracture toughness of the reactor pressure vessels (RPV), we decided that action should be taken to resolve the long term problems. Accordingly, under 10 CFR 50.54(f), by letter dated August 21, 1981 we requested from licensees of eight plants (based on the reference temperatures of the RPV and system characteristics), information concerning the issue of PTS to RPV. Specifically we requested within 60 days information related to: (1) the Reference Temperature for Nil Ductility Transition (RT_{NDT}) for the RPV and (2) operator action to prevent pressurized thermal shock and ensure vessel integrity. Also, we requested within 150 days information which would define actions and schedules for resolution of the PTS issue and analyses to support continued operation.

The eight plants selected were: Fort Calhoun, Robinson 2, San Onofre 1, Maine Yankee, Oconee 1, Turkey Point 4, Calvert Cliffs 1 and Three Mile Island 1.

By Commission Paper SECY 81-687 dated December 8, 1981, PTS was designated as an Unresolved Safety Issue. However, at the Commission briefing of November 24, 1981, we committed to having a staff position by Summer 1982 and by memorandum dated November 24, 1981 (Harold Denton to D. Eisenhut and S. Hanauer) Harold Denton directed that for those plants of immediate concern DL should manage the development of a short term resolution which can meet the scheduled committed to the Commission (Summer 1982).

Current Status:
The "60 day" and 150 day responses have been received for all plants except TMI-1. GPU will be submitting their 150 day response by the end of June 1982. The responses are under review in addition to supplemental information provided as a result of the Staff's meeting with industry representatives of June 9, 1982. A staff position is being formulated and a staff report to the Commission is being prepared.

Action Required to Complete MPA:
Our input is being prepared with appendices which will address evaluation and recommendation for each plant. The distribution of the report and the type of action which will follow will evolve after the staff's presentation to the Commission.

Multi-Plant Action No. B-69

No. of Plants: 47 Operating Reactor Plants

Title: PWR Main Steam Line Break with Continued Feedwater Addition

(IE Bulletin 80-04)
Priority: High

Cognizant Assistant Director: T. M. Novak

Lead Engineer: R. A. Clark

Lead Technical Review Branch: CSB/DSI

Other Review Branches: RSB, ICSB/DSI

Problem:

A licensee submitted a report to NRC identifying a deficiency in the original main steam line break (MSLB) analysis for their plant. They determined that, if the auxiliary feedwater system continued to supply feedwater at runout conditions to the affected steam generator, containment design pressure would be exceeded in about 10 minutes. The long term effect of the water supplied by the auxiliary feedwater system also had not been considered in prior analyses.

Background:

Virginia Electric and Power Company (VEPCO) submitted a report to the Nuclear Regulatory Commission (NRC) dated September 7, 1979 identifying a deficiency in the original main steam line break (MSLB) analysis for North Anna Power Station, Units 3 and 4. Stone and Webster Engineering Coproration re-analyzed the containment pressure response following a MSLB and determined that, if the auxiliary feedwater system continued to supply feedwater at runout conditions to the affected steam generator, containment design pressure would be exceeded in about 10 minutes. The long term effect of the water supplied by the auxiliary feedwater system had not been considered in prior analyses.

On October 1, 1971, IE Information Notice No. 79-24 was sent to all holders of operating licenses and construction permits, informing them of VEPCO's finding. The Consumer Power Company of Michigan (Palisades, Unit 1 facility) conducted an accident analysis review pursuant to the Information Notice and found that with offsite power available, the condensate pumps would feed the affected steam generator at an excessive rate. This was not considered in their analysis of the MSLB accident.

Because of the deficiencies that were identified in the original MSLB analyses, IE Bulletin No. 80-04 was issued on February 8, 1980. The IE Bulletin requested licensees and certain applicants of PWR facilities to assess the effect of continued feedwater or condensate addition on the containment response and reactor core reactivity response to a MSLB accident. The IE Bulletin was sent to all licensed PWR facilities and to those PWR facilities nearing licensing (Diablo Canyon, McGuire, North Anna 2, Salem 2, and Sequoyah).

Current Status:

As of May 1, 1981, 46 PWR licensees have responded to IE Bulletin 80-04. On August 17, 1981, Franklin Research Center was authorized to begin work reviewing the responses to IE Bulletin 80-04. As of April 16, 1982, Franklin Research Center concluded that some licensee submittals did not provide adequate information for them to complete their review; licensees are being requested to provide the additional information. This assignment is expected to be completed by the contractor by September 30, 1982.

Action(s) Required to Complete the Licensing Action:

1) Review licensees' response to IE Bulletin 80-04.
2) Evaluate licensees' responses.
3) Evaluate licensees' corrective actions.
4) Issue Safety Evaluation Report on licensees' response and corrective actions.

Updated: 6/17/82

Multi-Plant Action No. C-01
Title: PWR Secondary Water Chemistry
Lead Project Manager: M. Grotenhuis
Priority: 2
Technical Review Branch(es): ChEB

Statement of Problem:

PWR facilities only are affected. The NRC staff's testimony at the January 1976 Prairie Island public hearings on steam generator tube integrity set forth the regulatory position regarding secondary water chemistry monitoring requirements. The NRC position is that monitoring requirements are needed to assure control of harmful impurity buildup in the steam generator that could cause tube corrosion and impair tube integrity.

Background:

Letters were sent to PWRs requesting Technical Specifications changes to incorporate Secondary Water Chemistry monitoring requirements; a number of licensees objected to this approach on the basis of potential limitations to plant operating flexibility. NRC changed its position and requested a license condition that requires the implementation of a secondary water chemistry monitoring and control program containing appropritae procedures and administrative controls.

Current Status:

Five plants remain to be closed out. Many facilities were resolved by ORPM's owing to a lack of Technical Review priority in the post TMI period. Recent scheduling of tasks inside the NRC has made Technical Review capacity again available enabling planning for a relatively early completion.

A contractor is now involved; this is Brookhaven National Laboratories. All actions are scheduled for completion this fiscal year.

Action(s) Required to Complete the MPA:

Outstanding licensee submittals have been reviewed. Requests for additional information have been sent to related ORPMs.

NRR/ORPM is reviewing the request for additional information.

Status Updated: 6/16/82

Multi-Plant Action No. C-03

No. of Plants: 3 Plants Remaining (Kewaunee, Peach Botton 1&2)

Title: Qualification of Radiation Protection

Priority: N/A

Cognizant Assistant Director: Tom Novak

Cognizant Branch Chief: Robert Clark

Lead Engineer: Dom DiIanni

Lead Technical Review Branch: NONE

Other Review Branches: DL

Problem:

Issue license amendments commiting the licensee to meeting the requirements of Reg. Guide 1.8 for the qualification of the Radiation protection manager.

Current Status:

All licensees have committed to this requirement and the Tech Specs have been revised accordingly except for the licensee's of the Kewaunee and Peach Bottom 1&2 Nuclear power plants. License amendments for these three plants need to be issued in order to complete MPA. This effort is with DL and it appears the Kewaunee Tech Specs can be issued in June 1982. Peach Bottom 2/3 is scheduled for issuance by July 30, 1982.

Action(s) Required to Complete the Licensing Action:

The PMs for Kewaunee (M. Grotenhuis) and Peach Bottom 1&2 (M. Fairtile) are to issue an amendment to the licensee that commits the licensees.

Status Updated 6/17/82

Multiplant Action Number C-04

Title ESF Filter Tech. Specs.

Lead Project Manager C. Tropf

PRIORITY 3

Technical Review Branch (es) ETSB

Statement of Problem:

Some licensee have not submitted T. S. Regarding ESF filters which comply with the position of RG 1.52

Background:

Letters sent out in 1976-1977 to all licensees. Most have been completed.

Current Status:

7*plants are outstanding. All T. S. to be issued by 9/82.

Actions Required to Complete the MPA:

Resolve open items in reviews. Project Managers are pursuing

*Surry 1/2, Maine Yankee, Indian Point 2, Haddam Neck, Palisades, Rancho Seco

Status Updated June 15, 1982

Multiplant Action Number: C-06

Title: Pump Support - Lamellar Tearing

Lead Project Manager: R. Emch

Priority: 2

Technical Review Branch: GIB

Statement of Problem:

The potential for low fracture toughness and lamellar tearing on steam generators (including vessel, pressurizer and torus supports) exists due to variability in fracture toughness and resistance to corrosion of support materials.

Background:

Was unresolved safety issue A-12. Additional complication is that supports other than integrally welded are not covered in ASME Code and GDC and may require rule-making. Resolution of issue will occur with issuance of the "Final" NUREG-0577 in early 1982.

Current Status:

1. Acceptance criteria will be provided in NUREG-0577

2. No schedule has been set.

3. GIB/DST (Dick Johnson) has responsibility; however, 6 plants (Indian Point 2/3, San Onofre 1, Turkey Point 3/4, and Arkansas 2) will be reviewed under FRC contract (Bill Koo). These plants did not provide adequate information orginally. Preliminary reviews have been completed onthese 6 plants, but the detailed review is waiting for guidance of NUREG-0577.

Actions Required to Complete the MPA:

Completion of NUREG-0577 is first step. Further steps to be determined based on guidance in NUREG.

Status Updated: January 27, 1982

Multiplant Action Number: C-07

Title: Fuel Handling Accident Inside Containment

Lead Project Manager: C. Tropf

Priority: 2

Technical Review Branch(es): ____________

Statement of Problem:

By letter dated January 3, 1977 to Commissioner Gilinsky, Mr. Robert Pollard recommended that NRR review the potential consequences of a postulated fuel handling accident at each operating plant because this accident had not been considered during licensing of the plants.

Background:

Letters were sent to licensees of 39 operating plants in January 1977 requesting that they provide a detailed evaluation of the potential consequences of this accident. Letters were not sent to licensees of 24 operating plants because this accident had been evaluated in their SER.

Current Status:

There are 4* plants which are not complete. The issues range from concerns regarding X/Q to acceptability of filers.

Action Required to Complete the MPA:

The project managers are pursuing resolution of the remaining issues.

*Surry 1/2, Maine Yankee, Indian Point 2

Status Updated: June 16, 1982

Multi-Plant Action No. C-10

No. of Plants: 54

Title: Control of Heavy Loads at Nuclear Power Plants

Priority: Phase I, High; Phase II, Medium

Cognizant Assistant Director: Tom Novak

Cognizant Branch Chief: Robert A. Clark

Lead Engineer: Glode Requa

Lead Technical Review Branch: Auxiliary Systems Branch

Other Review Branches: None

Problem: Dropped Heavy Loads may impact spent fuel, fuel in the core, or equipment that may be required to achieve safe shutdown and continued decay heat removal for PWRs and BWRs. If sufficient spent fuel or fuel in the core were damaged and if the fuel is highly radioactive, the potential releases of radioactive material could result in off-site doses that exceed 10 CFR Part 100 limits.

Background: USI - Task A-36 was established to examine staff licensing criteria, the adequacy of measures in effect at operating plants, and to recommend necessary changes to assure the safe handling of Heavy Loads. NUREG-0612 provides the results of the review and includes the task groups recommendation.

Current Status: NUREG-0612 was issued to all licensees by letter dated December 22, 1980. The letter requested; interim actions to be completed in 90 days, a Phase I Action (report, confirmation and justification) in six months and Phase II (specific requirements) in nine months.

The criteria contained in NUREG-0612 is used for the acceptance criteria. Schedules have been established provide 59 technical inputs to DL for FY82 from the contractor for Phase I only. The contractor is Franklin Research Center (FRC). FRC provides TER's to the lead technical group ASB.

Actions Required to Complete the Licensing Action:

1. Review licensees Phase I submittals, resolve any staff disagreements with submittals and issue a SER to licensee.

   50 TERs are to be completed in FY82.
   13 TERs are to be completed in FY83.
   50 SERs to licensees are scheduled for FY82.
   22 SERs to licensees are scheduled for FY83.

2. Review licensee's Phase II submittals same as item 1.

   40 TERs are scheduled for completion during FY83.
   32 TERs are scheduled for completion during FY84.
   40 SERs are scheduled for completion during FY83.
   32 SERs are scheduled for completion during FY84.

Status updated 1/21/82.

Multiplant Action Number: C-11

Title: Reactor Protection System (RPS) Power Supplies

Lead Project Manager: J. Van Vliet

Priority:

Technical Review Branch: ORAB

Statement of Problem:

Design deficiencies have been identified in the BWR RPS MG set regulatory systems that could adversely affect the operability of the RPS if (1) a sequence of undetected single component failures were to occur or (2) a seismic event occurred that resulted in the postulated component malfunctions.

Background:

The design deficiency was first identified during the Hatch 2 licensing process. By letter dated August 7, 1978 the other BWRs were directed to review their designs and submit a report. That letter also directed that a surveillance program be implemented. By letter dated September 24, 1980 the licensees were requested to: (1) commit to installing a Class 1E system, (2) provide a schedule for completion of the modification, and (3) provide a schedule for submitting design information and proposed Technical Specifications. All licensees responded satisfactorily.

Current Status

LLNL is writing TERs based on licensee submittals. ORAB is writing SERs. Vendor delays in delivering monitoring packages have forced three licensees to defer the modification until FY 84. Other deferrals may be necessary. Ten SERs will be issued in FY 82 and seven in FY 83. No unresolved technical issues exist for this item.

Actions Required to Complete the MPA:

1. Review licensee's designs (post-implementation)
2. Review licensee's proposed TS changes
3. Issue license amendment that revises TS

Status Updated: June 16, 1982

Multi-plant Action Number: C-14

Title: SEISMIC QUALIFICATION OF AUXILIARY FEEDWATER SYSTEMS

Lead Project Manager: J.T. Beard

Priority: 1

Technical Review Branch(es): ORAB

Statement of Problem

Since TMI-2, great attention has been focused on the ability of PWR's to reliably provide for shutdown decay heat removal at normal system pressure. The steam generator is the preferred and proven choice for accomplishing a safe shutdown of the plant. Therefore, the auxiliary feedwater systems (AFW) should satisfy the seismic design criteria for the Safe Shutdown Earthquake (SSE), consistent with other safety-related systems in the plant. However, only those facilities licensed recently have been reviewed against the NRC Standard Review Plan which treats the AFW as an Engineered Safety Feature.

Background

In August 1980, the NRC completed a preliminary study of the risk of a seismically induced loss of decay heat removal for plants without a seismically qualified AFW. One of the conclusions was that the increase in risk during the next three years is sufficiently small to allow plant operations to continue. Another conclusion was that plants should be surveyed to confirm the extent of the PWR plants without seismically qualified AFW.

In February 1981, the NRC developed and embarked on Multi-plant Action Plan C-14, "Seismic Qualification of Auxiliary Feedwater Systems." An objective to this plan is to increase, to the extent practicable, the capability of those plants without seismically qualified AFW to withstand earthquakes up to the SSE level. This multi-plant plan is described in an NRC memorandum to H. Denton dated February 20, 1981. The first phase is: (1) to identify, via a walkdown of the AFW system, deficiencies ammenable to simple remedial actions, and (2) to survey the plants to determine the extent and areas where significant improvements may be needed. The second phase is to have licensees complete re-analysis and/or significant modifications, for those plants which cannot demonstrate reasonable assurance of the functioning of the AFW system following an earthquake of SSE magnitude. After phase one, the NRC will complete certain decision-making processes and to take action to require licensees to make improvements.

Current Status

In a Generic Letter (GL 81-14), dated February 10, 1981, the NRC requested under 10 CFR 50.54(f) that all operating PWR licensees complete AFW walkdowns and report information regarding the seismic capability of AFW. This action implemented the first phase of the C-14 program.

Lawrence Livermore National Laboratory under technical assistance contract FIN A-0414 is reviewing and evaluating the licensees' responses to GL 81-14. Of the 47 PWRs involved with this MPA, LLNL has found it necessary so far to generate Requests for Additional Information for 44 plants, in order to correct deficiencies in licensees' responses or to obtain technical clarification of the licensees' responses.

In FY81, 2 TACS were completed. To date in FY82, 10 TACS have been completed, in that these plants have AFW designs that do not warrant further attention under this MPA program.

Actions Required to Complete the MPA

Thirty-five plant TACS remain active. LLNL is reviewing licensees' responses to Requests for Additional Information. The objective is to verify that AFW system walk downs were conducted and deficiencies identified, to report the level of seismic qualification of each area of the AFW, and to identify plants for which significant re-analysis and/or modifications may be needed. The results of this evaluation are to be reported both on a per plant basis and in a summary form for all the plants involved.

It is anticipated that LLNL can complete this effort (Phase I of the MPA) about the end of FY82.

Status Update

April 6, 1982.

Multi-Plant Action No.: D-01

No. of Plants: 22

Title: Mark I Containment Program

Priority:

Cognizant Assistant Director: T. Novak

Cognizant Branch Chief: D. Vassallo

Lead Engineer: B. Siegel

Lead Technical Review Branch: None - Work to be performed under Technical Assistance Contract

Other Review Branches: ORAB & Chris Grimes

Problem:

Since the original design of the Mark I containment system additional loading conditions resulting from the dynamic effects of drywell air and steam being rapidly furled into the suppression pool during a postulated LOCA and from suppression pool response to SRV operation generally associated plant transient operating conditions have been identified, the objective of this program is to restore the originally intended design safety margins for each Mark I containment system.

Background:

A Mark I Owners Group (OG) with GE the lead technical organization was formed to quantify the hydrodynamic loads and assess the effects of these loads on the Mark I containment structure. The OG divided this task into a short term (STP) and long term program (LTP).

The objectives of the STP were to verify that each Mark I containment system would maintain its integrity and functional capapability when subjected to the most probable loads induced by a postulated design-basis LOCA, and to verify that licensed Mark I BWR facilities would continue to operate safety, without endangering the health and safety of the public, while a methodical, comprehensive LTP was being conducted. The staff in the "Mark I Containment Short-Term Program Safety Evaluation Report," NUREG-0408 concluded that sufficient margin of safety had been demonstrated to assure the functional performance of the containment system and, therefore, any undue risk to the health and safety of the public was precluded.

The objectives of the LTP were to establish design-basis loads that are appropriate for the anticipated life of each Mark I BWR facility (40 years), and to restore the originally intended design-safety margins for each Mark I containment system. The principle thrust of this program has been the development of generic methods for the definition of suppression pool hydrodynamic loading events and the associated structural assessment techniques for the Mark I configuration. The generic anslysis techniques are intended to be

used to perform a plant-unique analysis (PUA) for each Mark I facility. The staff in the "Mark I Containment Long-Term Program Safety Evaluation Report," NUREG-0661 concluded that the load definition procedures utilized by the BWR Owner Group, as modified by the staff's requirements provide conservative estimates of these loading conditions and that the structural acceptance criteria are consistent with the requirements of the applicable codes and standards.

Current Status:

The licensees are in the process of performing PUA and designing and installing modifications to meet the Commission's Order date for each operating plant. Based on the staff's review of the Mark I Owners Group June 29, 1981 submittal the staff prepared a Commission Paper (SECY-81-678) requesting Commission approval for extension of the exemptions and completion dates for plant modifications needed to comply with the staff's acceptance criteria contained in Appendix A to NUREG-0661. Commission approval was received on January 8, 1982 Orders extending the exemptions and completion dates were sent out to 21 of the 22 operating reactors (Cooper Nuclear Station will meet the existing Order date and therefore did not require an extension). The licensees are in the process of preparing plant-unique analysis for staff review. Plant unique analyses reports have been received from two of the fifteen licensees.

Actions Required to Complete the Licensing Action:

1) Submittal of the PUA to the NRC
2) Post implementation audit of PUA by Franklin Institute and BNL on Technical Assistance Contracts
3) Issuance of SER to each licensee on acceptability of Mark I LTP modifications and analyses for their plant.
4) Technical Specification changes resulting from Mark I Modifications

Status Updated: 4/16/82

Multiplant Action Number D-04

Title PWR Reactor Vessel Cavity Seal Ring Missile Potential.

Lead Project Manager Charles Trammell

Priority 2

Technical Review Branch(es) ORB #3

Statement of Problem:

The reactor vessel cavity seal ring can become a missile if left in place during operation should a LOCA occur in or near the reactor vessel cavity.

Background:

Trojan disclosed this as a possible problem via an LER. On 2/2/78, letters were sent to all PWR licensees requesting a solution by either (a) removing the seal ring during operation or (b) confirming by analysis that the seal ring can withstand blowdown forces.

Current Status:

38 plants-completed.

4 plants-remain to be completed:

Haddam Neck

San Onofre 1

Surry 1

Surry 2

The remaining 4 plants have submitted "leak-before-break" analyses in response to MPA D-10, "Asymmetric LOCA Loads." It is expected that NRC will accept this analysis. If so, this will also solve D-4 for these plants, since the seal ring will not become a missile under "leak" conditions.

Actions Required to Complete the MPA:

The resolution of the 4 remaining plants (identified above) is dependent on the resolution of D-10 as described above.

Status Updated:

June 16, 1982

Multi-Plant Action No. D-05
Title: Plant UPI Model Problem
Lead Project Manager: M. Grotenhuis
Priority: 3
Technical Review Branch: RSB

Statement of Problem:

Only 2 loop PWR's are affected. All Westinghouse (W) 2 loop plants have a Low Pressure Safety Injection System (LPSI) which injects water directly into the Upper Plenum of the Reactor Vessel (UPI). This is used to counter the consequences of a single failure for 2 loop units.

However, the currently approved ECCS evaluation models for two loop plants are based on an ECCS system in which LPSI is directly to the cold leg of the Reactor Coolant System and because of this may be considered as not meeting the requirements of 10 CFR Appendix K Section II.5.

Background:

This has been an outstanding issue for two loop plants since the implementation of Regulations for an approved ECCS system. The issue became a MPA during late 1977 and 1978 when an "interim" model was developed to review the potential effect of UPI against the conventional model.

Current Status:

Six facilities are affected. W 2 loop UPI plants are presently operating on the bases of a number of approaches being taken to determine allowable peaking coefficients in an interim manner.

Acceptable long term resolution involves development of satisfactory generic models with plant specific application. Both W and Exxon fuels are involved.

Contractors are to be involved in the review of proposed models to develop acceptable generic resolutions (1982).

Plant specific applications are proposed for fiscal year 1983.

The Lead Project Manager has reviewed the history and current status of this item, and has made recommendations on future action to expedite completion.

Action(s) Required to Complete the MPA:

Review of Lead Project Managers proposal with RSB and NRR management to develop a mutually acceptable "modus operandi."

A proposal has been made by NRC (R. S. B.) to undertake at least two experiments in the Cylindrical Core Test Facility (CCTF) available in Japan to improve validation of current approaches.

Status Updated: 6/16/82

Multiplant Action Number: D-10

Title: Asymmetric LOCA Loads on Primary Reactor Coolant System

Lead Project Manager: J. Shea

Priority: Medium

Technical Review Branch(es): MEB, MTEB, CPB, CSB

Statement of Problem:

Asymmetric loads resulting from rupture of the primary piping could potentially damage reactor vessel support internals and other primary system components. Damage to the reactor internals could impair core coolability.

Background:

In January 1978, all pressurized water reactor (PWR) licensees were required by the NRC to provide an assessment of the adequacy of their reactor vessel supports and other affected structures to withstand combinations of responses to asymmetric loss-of-coolant accident (LOCA) loads and the Safe Shutdown Earthquake (SSE). This potential safety problem was subsequently identified as an unresolved safety issue Task Action Plan A-2.

Current Status:

All PWR plant assessments for asymmetric loads have been received and are currently being evaluated by staff and contractor EG&G. As a basis for this evaluation, staff is implementing criteria developed as part of the Task Action Plan A-2. These criteria are included in NUREG-0609. Concurrently, some PWR licensees have performed a study of "leak before break". Staff approval of the "leak before break" concept is expected in July 1982.

Action Required to Complete the Licensing Action:

Complete evaluation of Owners Group submittals including Westinghouse Owners Group proposed "leak before break" concept and plant specific submittals and issue SER.

Status Updated: June 16, 1982

Multiplant Action Number: D-12

Title: BWR Non Jet Pump Core Spray Performance

Lead Project Manager: P. J. Polk

Priority: 3

Technical Review Branch: ORAB

Statement of Problem:

Core Spray System nozzle coverage differs in a steam environment vis-a-vis an atmospheric environment. The original design is based on atmospheric analyses and tests. The generic issue requires that nozzle coverage be reanalyzed to reflect the steam environment.

Background:

History is inappropriate since only one plant remains outstanding.

Current Status:

All non-Jet Pump BWRs have either made the necessary modifications or committed to same with the exception of Nine Mile Point.

1) Acceptance criteria to be used in resolving the issue; to be provided by ORAB
2) Important schedule considerations; None (low Priority)
3) Where more than one review branch is involved, responsible branches with a breakdown of each branch's responsibilities; (ORAB Only)
4) Identification and role of contractors; None

Actions Required to Complete the MPA:

Review and approval of both the Oyster Creek and Nine Mile Plants is necessary to complete this generic activity.

Status Updated: June 17, 1982

Multi-Plant Action No. D-15

No. of Plants: 70

Title: High Energy Line Break and Consequential System Failure

Priority: 3

Cognizant Assistant Director: T. M. Novak

Cognizant Branch Chief: S. A. Varga

Lead Engineer: M. Grotenhuis

Lead Technical Review Branch EQB, RRAB, GIB

Other Review Branches:

Problem: Certain non-safety grade equipment, if subjected to an adverse environment, could impact the safety analyses and the adequacy of the protective functions performed by safety grade equipment. The NRC is concerned that a potential may exist at operating light water reactor facilities, for an unreviewed safety matter related to the effects of the environment on control systems resulting from high energy line breaks inside or outside containment and the results of these effects on the required safety systems.

Background:

On September 17, 1979, the NRC requested that all LWR licensees review their plants to determine whether control system failures caused by high energy line breaks (HELB) could result in consequences more severe than previously analyzed for the HELB. All licensees responded in a timely manner (20 days). A status reported from D. G. Eisenhut to H. Denton dated October 15. 1979 provided a basis for continuing operation. A meeting with representatives of the nuclear industry was held on November 9, 1979. A status report P. S. Check to D. G. Eisenhut dated December 19, 1979 stated that the NRC task group had found no specific identified safety problems. There were remaining concerns which fall within the scope of NUREG-0660 II.C.3.

Current Status:

All TAC's issued on this subject are still open. A memo has been prepared which includes instructions to PM's to close the issue and sent a letter to each utility informing them that any continuing effort by the staff will be under NUREG-0660 II.C.3.

Actions Required to Complete the MPA:

D. Eisenhut has received the above memo and has requested a briefing on the matter. Following this each PM would receive the above instructions.

Status Updated: 6/16/32

Multiplant Action No.: D-17

Title: Definition of Operable

Lead Project Manager: Sydney Miner

Priority Medium

Technical Review Branch(es): None

Statement of Problem:

Clarification of the term "OPERABLE" as it applies to support system outages or multiple outages of redundant components.

Background:

In a letter dated April 10, 1980, an explanation of the problem plus accompanying illustrate examples of recommended changes contained in the associated bases, were delineated to all licensees. The licensees were required to submit proposed changes to tech specs applicable to their plant and to implement procedures designed to assure compliance with the specifications containing new requirements.

Current Status:

1. Acceptance Criteria
   The acceptance criteria that LCO should be incorporated in the Technical Specification which requires that the plants be in cold shutdown within 36 to 39 hours if redundant ECCS loops become inoperable either due to failures in redundant ECCS loops or the diesel generators.

2. Important Schedule Considerations
   No licensing actions are scheduled to be completed this year.

3. Review Responsibilities
   This MPA is being handled completely within the Project Management Organization.

Actions Required to Complete MPA:

1. Remaining Milestones

   (a) Approval of remaining changes to the Technical Specifications of the remaining plants.

   (b) Issuance of the SER and the License Amendments.

2. Plant Actions Remaining

   There are 17 remaining licensing actions.

Status Updated: 7/15/82

Multiplant Action Number: E-04

Title: BWR Single Loop Operation

Lead Project Manager: Dick Clark

Priority: Low

Technical Review Branches: RSB, CPB

Statement of Problem:

The standard BWR Technical Specifications do not permit a plant with two recirculation loops to operate either with one loop or in the natural circulation mode. Thirteen operating BWRs have requested approval to operate at reduced power levels with a single loop if problems develop with a jet pump, valve, seals, flow controller, etc., in the other loop. Most of the potential safety reviews can more appropriately be resolved on a generic basis.

Background:

Single loop operation at limited power levels had previously been authorized for 6 BWRs for short periods of time (one week to two months). Based on this operating experience, the staff has concluded that BWRs can be safely operated at least 50% power by natural circulation (i.e., without forced flow from any recirculation loop). Accordingly, as an interim measure, for those licensees who modified their application, the plants have been authorized to operate, if necessary, at power levels of 50% with a single recirculation loop. For operation above 60% power, there is a generic concern involving flow stability when operating with one rather than two recirculation loops.

Current Status:

A meeting was held October 22, 1981 with all BWR licensees and GE to discuss GE's evaluation of Browns Ferry's and other BWR operating experience with single loop operation. RSB and CPB have prepared a draft list of questions which we discussed in a meeting with GE on January 21, 1982.

Actions Required to Complete the Licensing Action:

Transmit requests for additional information to licensees. Review and evaluate responses. Prepare safety evaluations authorizing plants to operate on a single loop at power levels indicated by the revised ECCS analysis.

Status Updated: June 17, 1982

Multi-Plant Action No. E-05
No. of Plants: 3
Title: Westinghouse N-1 Loop Operation
Priority: Low
Cognizant Assistant Director: T. Novak
Cognizant Branch Chief: S. Varga
Lead Engineer: D. Wigginton
Lead Technical Review Branch: RSB
Other Review Branches: ICSB

Problem:

All Westinghouse plants have a provision in their license that prohibits operation with less than all loops (N) in service.

Background:

It may be desirable to operate plants with one loop out of service. Present restrictions in the license do not permit this type of operation.

Current Status:

Only three Westinghouse plants, Beaver Valley and Zion (1 and 2), have submitted proposed amendments for N-1 loop operation. Beaver Valley is lead plant and most of the review has been completed. Trojan, a plant without loop isolation valves, has expressed an interest in submitting an application.

Action(s) Required to Complete the Licensing Action:

NRC to review contractor (Franklin Inst., Lawrence Livermore) inputs and write SER on Beaver Valley. Zion review to follow. Other Westinghouse pLants will probably submit similar applications if Beaver Valley is approved.

FOREWORD

THE OPERATING REACTORS LICENSING ACTIONS SUMMARY IS DESIGNED TO PROVIDE THE MANAGEMENT OF THE NUCLEAR REGULATORY COMMISSION (NRC) WITH AN OVERVIEW OF LICENSING ACTIONS DEALING WITH OPERATING POWER AND NONPOWER REACTORS. THESE REPORTS UTILIZE DATA COLLECTED FROM THE DIVISION OF LICENSING IN THE OFFICE OF NUCLEAR REACTOR REGULATION AND ARE PREPARED BY THE OFFICE OF MANAGEMENT AND PROGRAM ANALYSIS.

THIS SUMMARY REPORT IS PUBLISHED PRIMARILY FOR INTERNAL NRC USE IN MANAGING THE OPERATING REACTORS LICENSING ACTIONS PROGRAM. ITS CONTENT WILL CHANGE BASED ON NRC MANAGEMENT INFORMATIONAL REQUIREMENTS.

TABLE OF CONTENTS

Definitions I-III

Section 1 Management Overview Report

A. Plot of Total Active Routine Actions by Month A1

B. Plot of New Actions by Month B1

C. Plot of Completed Actions by Month C1-C2

D. Routine Licensing Actions by Month D1-D2

E. Routine Licensing Actions - Power Reactors E1-E3

F. Routine Licensing Actions - Nonpower Reactors F1-F2

G. Manpower Summary by Facility G1-G3

H. Multi-Plant Issues Summary Report H1-H4

I. Multiplant Actions - Lead Assignments and Contract Information I1-I12

J. Operating Reactors Hearing Summary J1-J5

K. Completed Licensing Actions by Fee Class K1

L. FY to Date Multi-Plant Specific Action Summary L1

M. Multiplant Action Completion Schedule M1-M18

N. Requests for NRR Assistance - Status Report N1-N4

Section 2 TMI Licensing Actions

A. Plot of Total Active TMI Actions by Month A1

B. Plot of New TMI Actions by Month B1

C. Plot of Completed TMI Actions by Month C1

D. TMI Licensing Actions by Month D1-D2

E. TMI Power Reactors Licensing Actions E1-E3

F. Status of NUREG-0737 Requirements Schedule F1-F13

G. NRR Implementation Review Completion Status G-1

Section 3 Licensing Action by Power Reactor Condensed Management Report 1-209

Section 4 Multiplant Action Descriptions for Active Issues

Definitions

I. Licensing Actions

A. Active Licensing Action - an item which has been initiated but not completed.

1. Multi-Plant Licensing Action - a licensing action topic that applies to a class of reactors.

2. Plant Specific Licensing Action - a licensing action associated with a certain facility because of the uniqueness of the technical specifications or situation, e.g., reduce the number of incore detectors.

B. Types of Licensing Actions

1. Amendment - action that results in changes to facility licenses including technical specification changes.

2. Letters to Licensees - letters sent to licensee requesting information that will resolve or aid in the resolution of technical issues. Examples of letters sent to licensees are: fuel handling inside containment, assymmetric loads or reactor vessel materials surveillance.

3. Orders/Exemptions - actions on operating plant that result in an Order for Modification of a License or an exemption to the regulation.

C. Categories of Multiplant Actions

1. Regulation - actions directly attributed to a specific regulation requirements, e.g., inservice inspection/testing requirements 10 CFR 50.55a(g).(A-Series)

2. Operating Experience - action directly attributed to an occurrence of accumulative experience at licensed reactors e.g., fire protection. (B-Series)

3. Internal Review - action resulting from NRC staff reviews of license applications, generic topics and operating reactor licensing actions, e.g., reporting requirements, fuel handling accidents, or filter tech spec requirements. (C-Series)

4. New Information - action required as a result of current data which shows that previously accepted requirements are no longer acceptable or are overly restrictive, e.g., ECCS input errors, assymmetric loads, equipment qualification. This new information may result from technological advancements, research or advanced analytical studies. (D-Series)
5. Licensee Requests - action requested by the licensee that does not fit any of the other sources of licensing actions. Usually these actions are requested because of the licensee's desire to improve operational performance, e.g., core reloads, spent fuel pool modifications, or (N-1) loop operation. (E-Series)
6. TMI Related Actions - actions related to the TMI Action Plan. (F-Series)

II. Significant Dates

A. Initiation - This is the date an action was actually started or implementation was begun on a plant. It is the date that a letter was issued to the licensee initiating the action, the date of an amendment request, or the date a TAC was issued for an item arising out of an operating experience or new information event.

B. PM-Target - project manater's anticipated completion date for active items.

C. Licensing Action Complete - date on which all work, both technical and administrative was completed and sent out of the agency.

III. Definition of Priorities (Applicable to Multi-Plants or Plant Specific Actions)

A. High (1)

1. Required by Rule, Order or NRC Letter
2. Safety-related items that use definite improvements in safety or would reduce the likelihood of transients or accidents.
3. Hearing-related matters.
4. High public interest in issue.
5. Actions which, if not completed, will affect power level or scheduled restart of a facility.
6. § 2.206 petitions.

B. Medium (2)

1. Items which, if not completed could result in an otherwise unnecessary IE enforcement action.
2. Spent fuel pool expansions.
3. Task should be completed within six months.

C. Low (3)

1. Licensee requests for amendments that have low safety significance.
2. Licensee requests for amendments which may have safety significance but for which NRC action is not required during the next six months (e.g., in early submittal of a core reload).

TABLE I
MULTIPLANT ACTIONS - LEAD ASSIGNMENTS AND CONTRACT INFORMATION

Data as of 9/30/82

Multiplant Action Number	Title	Status*	Lead Project Manager	Review Contracted		Contract Information			
				Yes	No	Funding Division	Contract Manager	FIN No.	Contractor
A-01	10 CFR 50.55 A(g) - ISI	A	P. Tam	X		DL	H. Silver	B-8011	SAI
A-02	Appendix I - ALARA	A	P. Wagner	X		DL/DSI	S. Bajwa	B-6891	FRC II/EG&G
A-03	Security Reviews - Modified Amendment Plans	C							
A-04	Appendix J - Containment Leak Testing	A	W. Paulson	X		DL	S. Bajwa	B-6590	FRC I
A-05	GE Mark I Containment Tech Specs - Short Term	C							
A-06	Respiratory Protection System	C							
A-07	Appendix G - Fracture Toughness	C							
A-08	ECCS Evaluation - Generic Per 50.46 Compliance	C							
A-09	Pressure Vessel Beltline Material Surveillance	C							
A-10	Contingency Planning	A	E. McPeek		X				
A-11	Guard Training Plans	A	E. McPeek		X				
A-12	Vital Area Analysis	C							
A-13	Non Power Reactor Safeguards Plan	I							
A-14	10 CFR 50.55 A (G) - Inservice Testing	A	P. Tam		X				
A-15	Quality Assurance Request Regarding Diesel Generator Fuel Oil	C							
A-16	Qualification of Inspection, Examination, Testing and Audit Personnel	A	D. Jaffe		X				
A-17	Instrumentation to Follow the Course of an Accident (R.G. 1.97)	I**	J Shea						

* A = Active, C = Complete, I = Inactive.

** Action inactive pending Commission approval of SECY 82-111.

MULTIPLANT ACTIONS - LEAD ASSIGNMENTS AND CONTRACT INFORMATION

Multiplant Action Number	Title	Status*	Lead Project Manager	Review Contracted		Contract Information			
				Yes	No	Funding Division	Contract Manager	FIN No.	Contractor
B-01	Diesel Generator Lockout	A	T. Wambach		X				
B-02	Fire Protection	C							
B-03	PWR Moderator Dilution	C							
B-04	Reactor Vessel Overpressure Protection	A	A. DeAgazio	X		DSI			EG&G
B-05	Stress Corrosion Cracking - BWR RCSPB	A	R. Clark	X		DL	J. Donohew	A-6429	INEL
B-06	BWR Relief Valve	C							
B-07	Steam Generator Feedwater Flow Instability	C							
B-08	PWR HPSI-LPSI Flow Resistance	C							
B-09	Charging Systems Pipe Vibrations	C							
B-10	Burnable Poison Rod Failure - B&W	C							
B-11	Flood of Equipment Important to Safety	C							
B-12	Steam Generator Tube Inspection	C							
B-13	Fuel Rod Bow	C							
B-14	CEA Guide Tube Wear	C							
B-15	C-E Poison Rod Growth	C							
B-16	Emergency Planning and Revisions	C							
B-17	Tech Spec Surveillance for Hydraulic Snubbers	A	L. Engle		X				
B-18	Worthington RHR Pump Shaft Integrity	C							
B-19	Neutron Shielding - CE Reactors	C							
B-20	Containment Leakage Due to Seal Deterioration	C							
B-21	Loss of 125-V DC Bus Voltage with Loss of Annunciator System	C							

* A = Active, C = Complete, I = Inactive.

MULTIPLANT ACTIONS - LEAD ASSIGNMENTS AND CONTRACT INFORMATION

Multiplant Action Number	Title	Status*	Lead Project Manager	Review Contracted		Contract Information			
				Yes	No	Funding Division	Contract Manager	FIN No.	Contractor
B-22	Tech Spec Surveillance Requirements for Mechanical Snubbers	A	L. Engle		X				
B-23	Degraded Grid Voltage	A	R. Dudley	X		DL	J. Donohew	A-0250 A-6429	LLL & INEL
B-24	Venting and Purging Containment While at Full Power and Effect on LOCA	A	E. Reeves	X		DL	S. Bajwa	B-6590	FRC I
B-25	BWR Feedwater Nozzle Cracking	A	P. O'Connor		X				
B-26	Inadvertant Safety Injection During Cooldown	C							
B-27	Review Responses to IE Bulletin 78-03 (Offgas Explosions)	C							
B-28	BWR Jet Pump Flow Indication Elimination	C							
B-29	BWR Feedwater Pump Trip	C							
B-30	Steam Generator Replacement Program**	C							
B-31	Long Shift LHSI and Outside Recirculation Degradation	C							
B-32	Blocked SI Signal During Cooldown	C							
B-33	Iodine Spiking	C							
B-34	BWR-Weld Failure of Jet Pump Retainer Bolt	C							
B-35	Orifice Rod Assembly Integrity - B&W	C							
B-36	Resistance Temperature Detector (RTD) Response - CE	C							
B-37	Steam Generator Tube Denting and Support Plate Modifications - CE	C							
B-38	Tendon Surveillance - Bechtel Containments	C							
B-39	PWR Pressure - Temperature Limit Tech Specs	C							

* A = Active, C = Complete, I = Inactive.

** All new and pending reviews are being handled as plant specific actions.

MULTIPLANT ACTIONS - LEAD ASSIGNMENTS AND CONTRACT INFORMATION

Multiplant Action Number	Title	Status*	Lead Project Manager	Review Contracted		Contract Information			
				Yes	No	Funding Division	Contract Manager	FIN No.	Contractor
B-40	Pipe Support Base Plates	C

OPERATING REACTORS HEARING SUMMARY

Status as of 9/30/82

Facility	Project Manager	Hearing Attorney	Subject	Initiation Date	Status
Big Rock Point	R. Emch	M. Karman	Mixed Oxide Fuel	8/75	In indefinite suspension as a result of GESMO decision.
Big Rock Point	R. Emch	J. Moore	Spent Fuel Pool Expansion	9/25/79	Evidentiary hearing held 6/7/82-6/12/82, which covered about 40% of the contentions. Additional evidentiary hearings have not yet been scheduled for the remaining contentions.
Browns Ferry 1/2/3	R. Clark	R. Rawson	Onsite Storage of Low Level Waste	1/81	ASLB denied petitions to intervene. Appeal Board remanded issue back to ASLB and reinstated intervenors. Staff and TVA has appealed decision to the Commission. The Commission ordered briefs to be filed by the staff and TVA by May 6, 1982. Prehearing conference held April 1, 1982 in Huntsville, AL. SER and EIA issued June 4, 1982 and June 9, 1982, respectively. Commission remanded issue back to Appeal Board.
Dresden 1	P. O'Connor	R. Rawson	Decontamination	9/30/81	First Prehearing Conference has not yet been held. Contentions remain pending.

OPERATING REACTORS HEARING SUMMARY

Facility	Project Manager	Hearing Attorney	Subject	Initiation Date	Status
GETR	C. Nelson	D. Swanson	Seismic Show Cause Issues	10/24/77	Testimony completed; awaiting Initial Decision.
Ginna	J. Lyons	M. Young	Full Term Operating License Conversion	6/8/73	Based on our meeting the following schedules we anticipate that the evidentiary hearing for the POL Conversion to FTOL will be held in the Summer of 1983. FES update, October 1982; Final SEP (Integrated Safety Assessment) Report, October 1982; Conversion SER, October 1982; and SEP/Conversion SER Supplement, late winter.
Humboldt Bay	V. Rooney	M. Young	Deletion of Seismic Conditions	7/29/77	Motion to withdraw application for license amendment and to terminate the proceeding filed by the licensee on December 31, 1980. By memorandum and order dated February 17, 1982 the ASLB ordered the licensee to file status reports each 3 months. The ASLB also ordered that 6 months after the Commission reaches a decision on safety goals and issues guidelines the licensee must report to the Board a) readiness to take actions to permit resumed operation, or b) commit to submit a decommissioning plan.
Indian Point 2/3	J. Hannon	J. Moore	Risk Assessment of Plant	10/1/82	Prehearing conference to be held November 3-4, 1982.

OPERATING REACTORS HEARING SUMMARY

Facility	Project Manager	Hearing Attorney	Subject	Initiation Date	Status
LaCrosse	R. Dudley	C. Woodhead	Full Term Operating License (with seismic considerations)	6/23/78	With respect to environmental contentions, by Memorandum and Order dated August 2, 1982, the ASLB granted staff and applicant motions for summary disposition of all intervenor's environmental contentions, the Board directed the staff to correct the FES on matters involving energy alternatives. The proceeding also involves seismic issue from Show Cause (2.206) proceeding with FTOL proceeding. The FTOL proceeding is contingent upon the completion of the SEP for the facility.
Maine Yankee	K. Heitner	J. Gutierrez	Spent Fuel Pool Capacity Expansion	9/18/79	First Prehearing Conference completed. Two intervenors admitted. April 12, 1982 ASLB Order admits 14 contentions. June 16, 1982 SER & EIS issued. ASLB Order of July 20, 1982 schedules hearing for June 7, 1983. August 30, 1982 - Additional contentions from intervenors - September 30, 1982 Applicant & staff replies to contentions & intervenors response. ASLB rulings due 10/25/82.
North Anna 1/2	L. Engle	D. Swanson	Turbine Missile Risk	2/27/78	On June 2, 1982, the ASLAB issued ALAB-676, wherein the Appeal Board delineated its decision resolving the North Anna Turbine Missile Issue. All issues in this proceeding are terminated other than the issue of radon emissions in the milling & mining of uranium fuel. The radon issue will be addressed following resolution in other hearings which are contested.

OPERATING REACTORS HEARING SUMMARY

Facility	Project Manager	Hearing Attorney	Subject	Initiation Date	Status
Palisades	T. Wambach	C. Barth	Steam Generator Repair Program	7/23/79	Prehearing Conference was held on September 21, 1982. Following this conference, the ASLB has proposed to dismiss the proceeding due to lack of interest by the intervenor.
Point Beach 1	T. Colburn	R. Bachmann	Demonstration Tube Sleeving	7/20/81	Final ASLAP decision issued 10/1/82 supporting ASLB decision.
Point Beach 1/2	T. Colburn	R. Bachmann	Steam Generator Tube Sleeving	7/20/81	Staff EIA & SER issued on 6/30/82 and 7/8/82, respectively. Staff filed motion for summary disposition on 9/3/82 in response to intervenor's motion concerning litigable issues dated 8/20/82. ASLB ruled on summary disposition 10/1/82 memorandum and order. One generic issue admitted. Hearing scheduled for 11/17/82-11/20/82.
Point Beach 1	T. Colburn	R. Bachmann	Steam Generator Replacement	8/10/82	Intervenor filed request for hearing dtd 8/10/82. ASLB established pre-hearing conference set for 11/20/82.
Rancho Seco	S. Miner	R. Black	Commission Order of May 7, 1981, related to TMI Related Modifications	5/15/79	Initial Decision of ASLB under review by ASLAB sua sponte.

OPERATING REACTORS HEARING SUMMARY

Facility	Project Manager	Hearing Attorney	Subject	Initiation Date	Status
Salem 1	W. Ross	B. Smith	Spent Fuel Pool Modifications	3/7/78	Initial Decision issued October 27, 1980 authorizing amendment; affirmed by ASLAB on July 17, 1981 (ALAB-650). Commission declined review on November 9, 1980). Appeal has been filed before 3rd. Circuit Court of Appeals.
Three Mile Island 1	R. Jacobs	J. Gray J. Cutchin J. Goldberg	TMI-1 Restart	8/79	All Partial Initial Decisions issued; before the Commission for determination of immediate effectiveness. ASLAB also reviewing all ASLB PIDs.
Robinson 2	G. Requa	S. Treby	Radon	11/30/73	Partial Initial Decision issued by ASLB; affirmed by ALAB on October 31, 1979 (ALAB-569). Pending before ASLAB on radon only.

Section 4

Multiplant Action Descriptions for Active Issues

Multiplant Action Number: A-01

Title: 10 CFR 50.55a(g) ISI

Lead Project Manager: ?. Tam

Priority: 1

Technical Review Branch(es): MTEB

Statement of Problem:

Licensees for boiling or pressurized water-cooled nuclear power facilities are required by 10 CFR 50.55a(g) to have an inservice inspection program that meets the requirements of Section XI of the ASME Boiler and Pressure Vessel Code and Addenda (The Code). If the licensee determines that it is impractical to meet certain requirements of the Code, justification must be provided to the Commission, which can grant relief from specific Code requirements or impose alternate requirements.

Background:

Staff review is currently several years behind originally planned schedules. The staff has previously given interim implementation guidance to the licensees by letter. In general, this guidance authorized the licensees to implement their ISI plans as proposed pending completion of review by the staff. In some cases the period for which the proposed plans and interim implementation authorization would apply has expired and the licensees have made subsequent submittals before the staff completed review of the original plan.

Current Status:

The backlog of ISI relief requests is being reviewed by a contractor (SAI). After the current backlog is cleared, reviews of requests for relief from code requirements will be conducted on a plant specific basis with a schedule keyed to inspection program update requirements.

Actions Requred to Complete the MPA:

Thirty-one facilities remain to be reviewed in FY-83.

Status Updated: 9/30/82

Multi-Plant Action No. A-02

No. of Plants: 73

Title: Appendix A - ALARA

Priority: 1

Cognizant Assistant Director: G. C. Lainas

Cognizant Branch Chief: J. F. Stolz

Lead Engineer: P. C. Wagner

Lead Technical Review Branch Effluent Treatment Systems Branch

Other Review Branches: Radiological Assessment Branch

Problem:

Implementation of Technical Specifications called for in 50.36a and Appendix I to 10 CFR 50.

Background:

Appendix I was published in 1975 and Model TS were sent to all licensees on 7/78, 11/78 and 7/79. Submittals have been received from all licensees except Kewaunee.

Current Status:

Action completed on 4 plants (Farley 2, Sequoyah, McGuire and TMI-1). Site visits are being conducted to discuss RETs implementation. No TERs or SERs have been received, from either FRC or EG&G both of whom have been contacted for these reviews

Action(s) Required to Complete the Licensing Action:

1. Contractor and NRR visits to each site to discuss RETs implementation.
2. Contractor provide NRR with updated SERs and negotiated TS.

3. DL issue license amendment.

Status Updated: 9/30/82

Multiplant Action Number: A-04

Title: Containment Leak Testing - Appendix J

Leak Project Manager: W. Paulson

Priority: 1

Technical Review Branch: CSB

Contractor: Franklin Research Institute

Statement of Problem:

Some operating plants may not be in full compliance with Appendix J to 10 CFR Part 50.

Background:

Appendix J to 10 CFR Part 50 was published after many nuclear power plants had either received their operating license or their containments had reached an advanced state of design of construction. Accordingly, some plants may not be in full compliance with Appendix J. Licensee submittals, including exemption requests and proposed Technical Specifications need to be reviewed.

Current Status:

Franklin Research Center is under contract for performing the review of the 47 remaining plants in this program. All (46) TERs have been received from Franklin Research Institute. No TER is expected for Dresden 1 which is on hold. All 46 SERs have been forwarded to DL by CSB. Twenty-eight licensing actions have been completed.

Actions Required to Complete the MPA:

ORPMs are working on the remaining SERs in preparation for issuance.

Status Updated: 9/30/82

Multiplant Action Number A-10

Title Contingency Planning

Lead Project Manager E. McPeek

Priority High

Technical Review Branch(es)

(Primary) Power Reactor Safeguards Licensing Branch, NMSS

(Secondary) Standardization and Special Projects Branch, NRR

Statement of Problem:

Development of a plan to specify for licensee personnel specific objectives which they must achieve to detect and deter threats, thefts or radiological sabotage for all NRC licensed commercial power reactors.

Background:

NRC Rules, as stated in 10 CFR Parts 50 and 73, require each utility licensed by the NRC to operate a commercial power reactor to submit for NRC approval and to implement a safeguards contingency plan.

Current Status:

1. Acceptance criteria have been developed and are stated in the following:

   a. 10 CFR Part 73, Appendix C
   b. Regulatory Guide 5.44
   c. Review Guideline 24

2. The Power Reactor Safeguards Licensing Branch, NMSS has the lead responsibility for reviewing the plans from a safeguards viewpoint. The Standardization and Special Projects Branch has the lead responsibility for reviewing the plans from a plant safety viewpoint.

3. No contractors are utilized in this licensing review.

Action Required to Complete the MPA:

1. For operating power reactors all plans have been reviewed and four (2) remain to be approved. The NMSS staff has provided, through the appropriate NRR Project Manager, specific comments for consideration and action by the licensees. Once these issues are resolved, license amendments will be issued.

2. For applicants for operating licenses, the NMSS staff has taken review actions designed to complete the review and acceptance of each plan prior to the target date of the issuance of the SER.

Status Updated: 9/30/82

Multiplant Action Number: A-11

Title: Guard Training PLans

Lead Project Manager: E. McPeek

Priority: High

Technical Review Branch(es)

(Primary) Power Reactor Safeguards Licensing Branch, NMSS

(Secondary) Standardization and Special Projects Branch, NRR

Statement of Problem:

Development of a plan to specify an acceptable level of training to be provided to the licensee's security force for implementation at all NRC licensed commercial power reactors.

Background:

NRC Rules, as stated in 10 CFR Parts 50 and 73, require each entity licensed by the NRC to operate a commercial power reactor to submit for NRC approval and to implement a security force training and qualification plan.

Current Status:

1. Acceptance criteria have been developed and are stated in the following:

    a. 10 CFR Part 73, Appendix B
    b. NUREG-0674
    c. NUREG-0219
    d. NUREG-0576

2. The Power Reactor Safeguards Licensing Branch, NMSS has the lead responsibility for reviewing the plans from a safeguards viewpoint. The Standardization and Special Projects Branch, NRR has the lead responsibility for reviewing the plans from a plant safety viewpoint.

3. No contractors are utilized in this licensing review.

Actions Required to Complete the MPA:

1. For operating power reactors all plans have been reviewed and ten (4) remain to be approved. The NMSS staff, through the appropriate NRR Project Manager, has provided specific comments for consideration and action by the licensees. Once these issues are resolved license amendments will be issued.

2. For applicants for operating licenses, the NMSS staff has taken review actions designed to complete the review and acceptance of each plan prior to the target date of the issuance of the SER.

Status Updated: 9/30/82

Multiplant Action Number: A-14

Title: 10 CFR 50.55a(g) Inservice Testing

Lead Project Manager: P. Tam

Priority: 1

Technical Review Branch(es): MEB , R-I, R-II, R-III, R-IV, R-V, ORB #3

Statement of Problem:

Licensees for boiling or pressurized water-cooled nuclear power facilities are required by 10 CFR 50.55a(g) to have an inservice testing program that meets the requirements of Section XI of the ASME Boiler and Pressure Vessel Code and Addenda (The Code). If the licensee determines that it is impractical to meet certain requirements of the Code, justification must be provided to the Commission, which can grant relief from specific Code requirements or impose alternate requirements.

Background:

Staff review is currently several years behind originally planned schedules. The staff has previously given interim implementation guidance to the licensees by letter. In general, this guidance authorized the licensees to implement their IST plans as proposed pending completion of review by the staff. In some cases the period for which the proposed plans and interim implementation authorization would apply has expired and the licensees have made subsequent submittals before the staff completed review of the original plan.

Current Status:

The backlog of IST relief requests is being reviewed by the above named organizations. After the current backlog is cleared, reviews of requests for relief from Code requirements will be conducted on a plant specific basis with a schedule keyed to testing program update requirements. Thirty-six of the backlog facilities are being reviewed by the regions.

Actions Required to Complete the MPA:

Forty-six facilities remain to be reviewed in FY-82.

Status Updated : 9/30/82

Multi-Plant Action No. B-04

No. of Plants: 37

Title: Reactor Vessel Overpressure Protection

Priority: 2

Cognizant Assistant Director: T. M. Novak

Cognizant Branch Chief: J. F. Stolz

Lead Engineer: A. W. DeAgazio

Lead Technical Review Branch RSB*

Other Review Branches:

Problem:
Prevent overpressurizing the reactor vessel when at low temperature. Applicable to PWRs only.

Background:
A number of events have demonstrated that administrative controls alone are not adequate to prevent low-temperature overpressure events at PWRs. All PWRs were requested to provide an overpressure protection system that is to be used when the plant is in a low-temperature shutdown condition.

Current Status:
All plants implemented their system with preliminary NRC approval followed by post implementation review of (a) electrical aspects; (b) reactor system aspects; (c) Technical Specifications. Twelve plants remain for which licensing action is required. SERs are available for three of the plants with only PM processing required. The remaining nine plants are being reviewed by contract with EG&G for reactor system aspects through RSB. Previous contracts through ORAB have generated TERs for electrical aspects.

Actions Required to Complete the MPA:

Complete SERs for the nine plants. Review Tech Specs by PM and lead PM. Issue Tech Specs and SERs for remaining plants.

Status Updated: 6/16/82

---

*ORPMs responsible for integrating existing electrical, instrument and control TER with RSB's review.

Multiplant Action Number: B-05 (USI A-42)

Title: Stress Corrosion Cracking - Implementation of NUREG-0313, Rev. 1

Lead Project Manager: Dick Clark

Priority: High

Technical Review Branches: ORAB, MTEB

Statement of Problem:

Leaks and cracks in the heat-affected zones (HAZs) of welds in BWR austenitic stainless steel piping and components have been observed since the mid-1960's. All the cracks have been attributed to intergranular stress corrosion cracking (IGSCC). The revised purpose of this task is to insure that all BWRs have adequate programs--as defined in NUREG-0313, Rev. 1--to: (1) design systems constituting the reactor coolant system pressure boundry (RCSPB) to minimize the potential for IGSCC, (2) select materials for the RCSPB resistant to IGSCC, (3) control the water chemistry environment so as to reduce the potential for intergranular corrosion, (4) detect potential cracking through augmented inspections before it develops into a through-wall leak, and (5) detect possible RCSPB leakage before it becomes significant.

Background:

In 1975 NRC (AEC) formed a Pipe Cracking Study Group (PCSG) to investigate the cause of cracking in BWR piping. In July 1977 the staff issued an implementation document, NUREG-0313, based on recommendations of the PCSG. As a result of cracking in large diameter pipes and in nozzles which had not been observed prior to 1975, a new PCSG was activated in September 1978. In October 1979 Revision 1 to NUREG-0313 was issued for comment; this contained the latest recommendations of the Study Group. Based on industry comments, the document was modified and reissued. In view of the revised staff acceptance criteria, the previous reviews were terminated (TACs 08207 through 08230 plus 11263). New TACs have subsequently been issued (TACs 46651-46674) to cover the revised review effort.

Current Status:

In February 1981 NUREG-0313, Rev. 1 was issued to all holders of BWR operting licenses or construction permits and to all applicants for operating licenses. By July 1, 1981 the applicants/licensees were to provide their program for replacement of service sensitive lines and welds, their program for augmented inservice inspection, their program for improving the water chemistry environment and incorporation of adequate leak detection capability. These submittals are being reviewed by EG&G Idaho under a technical assistance contract.

Multiplant Action Number - B-05 (USI A-42) cont'd

Actions required to Complete the Licensing Action:

Review of individual applicant and licensee responses to determine if they meet the guidelines published in NUREG-0313, Rev. 1. These reviews were initiated in May 1982. Priority is being given to completing the reviews on those BWRs with furnace sensitized safe ends. A total of 24 reviews need to be completed for operating reactors, all of which are scheduled for completion in FY83.

Status Updated: 9/30/82

Multi-Plant Action No. B-17

No. of Plants: 60

Title: Tech Spec Surveillance for Hydraulic Snubbers

Priority: 1

Cognizant Assistant Director: T. M. Novak

Cognizant Branch Chief: R. A. Clark

Lead Engineer: Leon B. Engle, ORB #3

Lead Technical Review Branch ORAB

Other Review Branches:

Problem: Operability of snubbers for LWRs is required to provide assurance that the structural integrity of the reactor coolant system and all other related systems is maintained during and following a seismic or other event initiating dynamic loads. OPERABILITY is verified by an Inservice Inspection and Testing Surveillance program specified in plant Technical Specifications (TS). Recent operating experience has indicated the need for changes, clarifications and improvements in the Inservice Surveillance Requirements for hydraulic snubbers.

Background:
By letter dated November 20, 1981, the NRC requested that all power reactor licensee's (except SEP) incorporate the model NRC TS in plant specific Appendix A TS. A similar request was sent to SEP operating licensees on March 23, 1981. The NRC TS require that the visual inspection frequency be based upon maintaining a constant level of snubber protection to systems. In order to provide assurance of hydraulic snubber functional reliability, a representative sampling of plant installed snubbers must be functionally tested during plant shutdowns at 18 month intervals. The required sampling provides a confidence level of 95% that 90% to 100% of plant specific snubbers will be OPERABLE within acceptance limits.

Current Status:
1) Resolution of this action requires the issuance of an Operating License Amendment except in those cases where a given facility does not utilize hydraulic snubbers.
2) The FY82 Operating Plan requires the completion of 25 B-17 actions.
3) A total of 35 actions have been completed to date:

Actions Required to Complete the MPA:
1) 32 actions have been completed to date for FY82.
2) FY82 quota of 25 items completed plus 7 additional completed items.

Status Updated: 9/30/82

Multi-Plant Action No. B-22

No. of Plants: 66

Title: Tech Spec Surveillance for Mechanical Snubbers

Priority: 1

Cognizant Assistant Director: T. M. Novak

Cognizant Branch Chief: R. A. Clark

Lead Engineer: Leon B. Engle, ORB #3

Lead Technical Review Branch ORAB

Other Review Branches:

Problem:

OPERABILITY of snubbers for LWRs is required to provide assurance that the structural integrity of the reactor coolant system and all other related systems is maintained during and following a seismic or other event initiating dynamic loads. Operability is verified by an Inservice Inspection and Testing Surveillance program specified in plant Technical Specifications (TS). Prior to initiation of MB-22, mechanical snubbers had not been included in operating plant surveillance programs. Recent operating experience has indicated that mechanical snubbers require OPERABILITY requirements similar to those required for hydraulic snubbers.

Background:

By letter dated November 20, 1981, the NRC requested that all power reactor licensee's (except SEP) incorporate the model NRC TS for mechanical snubbers in plant specific Appendix A TS. A similar request was sent to SEP operating licensees on March 23, 1981. The NRC TS require that the visual inspection frequency be based upon maintaining a constant level of snubber protection to systems. In order to provide assurance of mechanical snubber functional reliability, a representative sampling of plant installed snubbers must be functionally tested during plant shutdowns at 18 month intervals. The required sampling provides a confidence level of 95% that 90% to 100% of plant specific snubbers will be OPERABLE within acceptance limits.

Current Status:

1) Resolution of this action requires the issuance of an Operating License Amendment except in those cases where a given facility does not utilize mechanical snubbers.
2) The FY82 Operating Plan requires the completion of 25 B-22 actions.
3) A total of 41 Actions have been completed to date.

Actions Required to Complete the MPA:

1) 25 actions have been completed to date for FY82.
2) FY82 quota of 25 items completed

Status Updated: 9/30/82

Multiplant Action Number: B-23

Title: Potential Equipment Failures Associated with Degraded Grid Voltage

Lead Project Manager: R Dudley

Priority:

Technical Review Branch(es): Power Systems Branch

Statement of the Problem:

Potential exists for supplying safety and non-safety equipment with voltage outside the range for which it was designed for longer than transient periods. Such conditions could result in safety-related equipment being unavailable to mitigate the consequences of an accident.

Background:

On July 20, 1976, Northeast Nuclear Energy Company (NNECo) reported that, following a trip of Millstone Unit No. 2 on July 5, 1976, several motors powered from 480 volt (v) motor control centers failed to start as required. The failure of the 480 v motors to start was traced to blown control power fuses on the individual motor controllers. These controllers received control power through 480 v/120 v transformers within the controller.

NNECo's investigation disclosed that, as a result of the plant trip, the grid voltage dropped from 352 kv to 333 kv. This voltage drop, in conjunction with additional voltage drops associated with the transformers involved, reduced the control power and voltage within individual 480 v controllers to a voltage which was insufficient to actuate the main line controller contractors. As a result, when the motors were signalled to start, the control power fuses were blown. Subsequent testing by NNECo showed that the contractors required at least 410 v to function properly.

NNECo concluded that under similar low voltage conditions, the operability of 480 v Engineered Safety Feature equipment could not be assured.

NNECo's immediate corrective action was to raise the setpoint of the Engineered Safeguards Actuation System (ESAS) "loss of power" under-voltage relays to assure that the plant would be separated from the grid and that emergency power system (dual) operation would be initiated before the control voltage fell below that required for contractor operation. A trip of the under-voltage relays causes the emergency buses to be de-energized and a load shed signal to strip the emergency buses, the diesel generators to start and power the emergency buses, and required safety related loads to sequence start on the buses.

Background (Cont'd)

On July 21, 1976, NNECo reported that the earlier corrective action taken was no longer considered appropriate because during starting of a circulating water pump, the voltage dropped below the new ESAS undervoltage relay setting. This de-energized the emergency buses, caused load shedding to occur, started the diesel generators and began sequencing loads onto the emergency buses in accordance with the design. However, during sequencing of the loads onto the buses, the voltage again dropped below the undervoltage relay setting which caused the load shed signal to strip the buses. The result was energized emergency buses with no loads supplied.

Current Status:

All utilities operating plants (BWR, PWR, HTGR) licensed prior to 1976 must provide under-voltage relays which separate the plant from the grid (in case of degraded grid voltage) and activate the plant emergency power system. The current DL schedule requires this item to be completed in FY-1982. Technical review is provided by the Power Systems Branch, with contractor technical support from Lawrence Livermore Lab and EG&G.

67 - operating plants covered by B-23
67 - SERs completed(14 of which have open items)
50 - Licensing Actions completed

Actions Required to Complete the MPA:

Complete the 14 remaining SERs. Complete the 17 remaining licensing actions.

Status Updated: 9/30/82

Multi-Plant Action No B-24*
*B-20 integrated into B-24 on 8/25/80

No. of Plants: 66

Title: Venting and Purging Containment While at Full Power and Effect of LOCA

Priority: High

Cognizant Assistant Director: T. Novak

Cognizant Branch Chief: S. Varga

Lead Project Manager E. Reeves, ORB#1, DL

Lead Technical Review Branch: CSB/DSI, M. Fields

Other Review Branches: EQB/DE, ORAB/DL & AEB/DSI

Problem:

Purging and/or venting of reactor containment buildings with reactor coolant temperature above 200°F may result in LOCA site boundary doses exceeding 10 CFR 50 Part 100 limits.

Background:

Events at Millstone 1 and Salem 1 (where the automatic high radiation closure of purge valves was overridden by operators) resulted in a generic letter being sent to all licensees of operating reactors in November 1978. A report was also made to Congress (#78-05). NRC advised of the events, requested licensees take action to minimize purge and vent operations, and requested response to SRP 6.2.4 and CSB BTP 6-4. In October 1979 an Interim Position was developed by the staff and licensees were requested to conform to it pending completion of our long-term review. In August 1980 generic item B-20 Leakage of Resilient Seals for purge and vent valves was integrated into the B-24 issue. A staff position to require Technical Specifications (as a leakage surveillance at either 3-months or 6-months intervals depending on valve usage) was developed and is included in the guidance being provided to licensees as specific plant reviews progress.

Current Status:

1. All licensees have responded to the November 1979 request for information. Reviews of licensee submittals are still underway although TMI-2 and the April 1980 reorganization of NRR caused delays. All licensee's responses to the October 1979 Interim Position have been reviewed and found acceptable as an interim measure. IE is monitoring licensees for continued compliance with these interim commitments.

2. The Lead Project Manager has issued guidance in memoranda dated August 25, 1980, March 24, 1981 and July 8, 1982 to all OL OR Branch Chiefs & PMs and to the Technical Review Team. The August 25, 1980 memorandum identified the new TACS, the reviewers and assignments to assure continuation of reviews during the NRR reorganization period after April 1980. Later status and guidance is described in item 4 below.

3. Contracts are/were managed by the Technical Review Team as follows:

   a. Electrical Reviews were managed by ORAB/DL with contracts to EG&G, Inc., Idaho and LLNL San Ramon, and FRC, Philadelphia. SEP reviews were managed by SEP with contract to EG&G Idaho.

   b. Valve operability reviews are managed by EQB/DE with contract to BNL.

   c. CSB 6-4 Review requirements were managed by CSB/DSI with contract to LLNL.

   d. Radiological Impact Reviews were managed by AEB/DSI with contract to EXXON Nuclear Idaho Company, Inc.

4. As of June 8, 1981, a sample letter prepared by ORB #1 (concurred in by CSB/DSI) was prepared for issuance to each licensee with the next NRC action letter (either Q's or SER). The sample letter (provided in Lead PM Memorandum dated June 19, 1981 to all Project Managers) contains the NRC position clarifications and sample Technical Specifications to close out the long-term reviews. The overall B-24 review will also complete TMI Item II.E.4.2, except for II.E.4.2.5 Containment Pressure Setpoint. On September 30, 1982 CSB/DSI provided SER's for II.E.4.2.6 and II.E.4.2.7. Project Managers were directed by Lead PM memorandum dated October 22, 1982 to complete all DL action on II.E.4.2 no later than the end of the first quarter FY83.

Actions Required to Complete B-24 and B-20 Licensing Actions:

1. Project Managers have issued the update status of the NRC reviews to each licensee except as noted below. This status letter was important to get the issue clearly understood by each PM and each licensee and to get the long term action completed. Lead PM records show that three plants (Davis-Besse, Millstone 2 and North Anna 1) have not been sent the status letter now scheduled for issuance by October 30, 1982. These letters contained the staff guidance and any existing staff SER's received to date.

2. CSB, EQB, AEB and ORAB should complete any remaining plant specific SER's and provide to Project Manager. Emphasis should be placed on completing the valve operability reviews on an expedited basis since these reviews are the most time consuming and have the most technical problems especially with valves larger than 20 inch diameter. Technical reviewers are providing a status report to the Lead PM on the SER's during each Quarterly Review Meeting.

3. Project Managers should review any licensee Technical Specification submittals and issue license amendments as required. Consult with Lead PM if problems occur.

4. TMI Item II.E.4.2.5 reviews by CSB have been completed except for Crystal River 3. Licensing action is complete except for Crystal River 3 and Palisades. Project Managers should complete this action.

Status Updated: 9/30/82

Multiplant Action Number: B-25

Title: Feedwater and CRD Nozzle Cracking

Lead Project Manager: P. W. O'Connor

Statement of Problem:

BWR feedwater nozzles and control rod drive nozzles have developed cracks due to thermal fatigue.

Background:

The generic issue has been resolved by the 11/13/80 issuance of NUREG-0619 which provided licensees of BWRs with acceptable methods to resolve the issue on a plant-by-plant basis.

Current Status:

Thirteen plants have committed to follow the staff's guidance and have received letters confirming that their proposed action is acceptable. The licensing action is complete on these plants. Each will submit a post-implementation report following completion of their proposed modification.

Ten plants are being reviewed to resolve deviations from NUREG-0619 guidance. Additional information and/or commitments are required from these plants to permit the staff to issue a confirmatory action letter or a show cause order to require compliance with staff requirements.

Actions Required to Complete the MPA:

Complete the review of the deviations on the eleven remaining plants. Obtain commitments to follow NUREG-0619 guidance or issue orders requiring compliance if necessary.

Status Updated: June 18, 1982

Multiplant Action Number: B-41

Title: Fire Protection - Final Tech Specs - Final SER Supplements

Priority: High

Lead Project Manager: T. Wambach

Review Branches: CEB, ASB, PSB, ICSB, RSB, PTRB, LQB

Statement of Problem:

Protection of safe, shutdown capability from the adverse effects of fire in any area of the plant. During the OL review of plants licensed prior to July 1976, no in-depth review was performed in this area.

Background:

Fire at Browns Ferry Nuclear Plant in March 1975 disabled redundant safety divisions and normal safe shutdown equipment. NUREG-0050.

Current Status:

10 CFR 50.48 and Appendix R to 10 CFR 50 became effective February 17, 1981. The licensees for 66 units licensed prior to January 1, 1979 and for 3 units licensed after January 1, 1979 are making submittals describing (1) plans and schedules to meet Appendix R, (2) design descriptions of alternative, safe shutdown modifications, and (3) exemption requests from Appendix R .

Action(s) Required to Complete the Licensing Action:

The submittals described above for all 69 units must be reviewed and acted upon . This will entail issuing exemptions, exemption denials and SERs approving alternative or dedicated safe shutdown modifications. Review of new OLs is now incorporated in the SRP. Final Tech Specs covering the equipment added as a result of Appendix R must also be issued after the modifications are complete.

Status Updated: 9/30/82

Multiplant Action Number: B-48

Title: Adequacy of Station Electric Distribution Voltage

Leak Project Manager: R. Dudley

Priority: 2

Technical Review Branch(es): PSB

Statement of Problem:

This review is intended to determine if the onsite distribution system in conjunction with the offsite power sources has sufficient capacity and capability to automatically start and operate all required safety loads within the equipment voltage rating.

Background:

At Arkansas Nuclear 1, loss of offsite power indicated that the electric distribution systems were inadequate for two unit operation. All utilities were asked to review their distribution systems to see if voltages were adequate.

Current Status:

69 - operating plants covered by B-48
56 - SER's completed (15 of which have open items)
36 - Licensing Actions completed

Actions Required to Complete the MPA:

Complete the remaining 28 SER's.
Complete the remaining 33 licensing actions.

Status Updated: 9/30/82

Multi-Plant Action No. B-57

No. of Plants: 44

Title: Decay Heat Removal Capability

Priority: 2

Cognizant Assistant Director: T. M. Novak

Cognizant Branch Chief: J. F. Stolz

Lead Engineer: A. DeAgazio

Lead Technical Review Branch None

Other Review Branches:

Problem:

To assure redundancy in decay heat removal capability by incorporation of requirements into the Technical Specification.

Background:

Various events at PWRs that have occurred during shutdown conditions have indicated that administrative controls to assure decay heat removal capability have been inadequate. All PWR licensees were requested (in a letter dated June 11, 1980) to incorporate requirements for redundancy into their TSs.

Current Status:

Acceptance criteria are: (1) redundancy in decay heat removal capability must be provided for all modes or temperature ranges of operation, particularly in Modes 4, 5 and 6, and (2) adequate surveillance requirements must be provided. A total of 16 plants remain to be reviewed. Indian Point 2 and 3 have not responded to our original request.

INEL is reviewing submittals and identifying where the proposed TSs, in conjunction with existing TSs, do not conform with our Standard TSs.

Actions Remaining:

1) Review applicable sections of the Kewaunee, Crystal River 3 and Palisades Technical Specifications
2) Review TER's as they are completed. Decide whether deficiencies are serious enough to warrant additional requests to licensees. If not, issue the license amendment as requested.

Status Updated: 6/16/82

Multiplant Action No. B-58a

No. of Plants: All BWRs

Title: BWR Scram Discharge Volume Technical Specifications

Lead Project Manager: K. Eccleston

Priority: High

Technical Review Branch: ORB#2

Statement of Problem:

Common cause failures of instrument volume level switches. Precursors at Hatch and Brunswick resulted in IE Bulletin 80-14.

Background:

Model Technical Specifications were sent to the industry by letter dated July 7, 1980. Submittals were subsequently received from the affected licensees and have been reviewed by the Franklin Research Center.

Current Status:

NRC contract NRC-03-81-130 has been issued to Franklin Research Center to review licensee submittals and write TERs. Final TERs for all 23 affected plants have been received as of 9/30/82; SERs have been provided for these plants.

Action Required to Complete the MPA:

Issue remaining license amendments upgrading TS.

Status updated: 9/30/82

Multiplant Action No. B-58b

No. of Plants: All BWRs (except LACBWR) - 23

Title: BWR Scram Discharge Volume Long Term Modifications

Lead Project Manager: K. Eccleston

Priority: High

Technical Review Branch: ASB

Statement of Problem:

Concerns raised as a result of the partial failure to scram event at Browns Ferry 3 on June 28, 1980 were documented in the staff's Safety Evaluation Report on the BWR Scram Discharge System dated December 1, 1980. A letter was issued on October 1, 1980 requesting a commitment to conform with revised criteria.

Background:

A letter dated December 9, 1980 forwarded the staff's generic SER with revised criteria. A letter dated March 30, 1981 provided clarification of the requirements for diverse instrumentation.

Current Status:

OMB clearance has been received and orders will be issued in near future.

Action Required to Complete the MPA:

Obtain acceptable responses and commitment dates. Issue orders with model Technical Specifications. Issue NRC contract to FRC to perform post-implementation verification or utilize regional inspectors, as appropriate.

Status updated: 9/30/82

Multi-Plant Action No. B-59

No. of Plants: 70

Title: Masonry Wall Design

Priority: 2

Cognizant Assistant Director: G. C. Lainas

Cognizant Branch Chief: R. A. Clark

Lead Engineer: Charles Trammell

Lead Technical Review Branch SEB, SEPB

Other Review Branches: ____________

Problem:
Inadequate design criteria for masonry walls. Applies to all plants.

Background:
Problem was discovered at Trojan during reviews associated with IEB 79-02 (anchor bolts) and IEB 79-14 (As-built verification). A masonry wall was found which supported numerous safety-related pipes which was not adequate to resist seismic forces. This resulted in the issuance of IE Bulletin 80-11 on May 8, 1980. NRR (SEB) has been assigned the responsibility to review licensee's responses to this Bulletin.

Current Status:
Franklin Research Center has been contracted to review most licensee submittals (exception: Trojan, Cooper, Dresden 1, Humboldt Bay, LaCrosse, Yankee-Rowe). Trojan is being reviewed by SEB. LaCrosse and Yankee-Rowe will be reviewed by SEPB. Dresden 1 and Humboldt Bay are currently in a shutdown status, and will be reviewed by SEB if/when needed. Cooper has no safety-related masonry walls covered by IEB 80-11. Close-out letter for Cooper has been issued (2/17/82). Review schedule and acceptance criteria for review have been established.

Actions Required to Complete the MPA:
62 plants remain to be completed. Eight finished to date. FRC review is active.

Status Updated: 9/30/82

Multiplant Action Number: B-60

Title: Environmental Qualification of Electric Equipment for
Nuclear Power Plants

Lead Project Manager: Jose A. Calvo

Priority: 1

Technical Review Branch: Equipment Qualification Branch

Statement of Problem: All plants are required to meet the Commission Memorandum and Order CLI 80-21 concerning 10 CFR 50, Appendix A, GDC 4.

Background: The issue originated from a 1977 petition from the Union of Concerned Scientists on fire protection and equipment qualification. The multiplant action arose from the Commission Memorandum and Order CLI 80-21. Technical resolution of acceptance criteria were produced from Unresolved Safety Issue A-24.

Current Status: Thirty-three (33) Technical Evaluation Reports have been issued by Franklin Research Center. It is anticipated that the remaining thirty-eight Technical Evaluation Reports will be completed by April 1983.

The environmental qualification rule is now in the final stages of approval. The final rule contains a new implementation schedule which would supersede the June 30, 1982 deadline for completion of environmental qualification of electrical equipment when the rule is adopted as final. The Commission had expected to publish the final rule by June 30, 1982, however this has not proved possible. Therefore, the Commission found it necessary to suspend the June 30, 1982 deadline pending publication of the final rule.

Previous staff's evaluations of the licensee's justifications for interim operation, for 33 operating plants, are being examined to determine if the previous conclusions are still valid in light of (1) additional knowledge gained through the FRC reviews to date, and (2) the extension of the interim period of operation, due to the Commission action to suspend the EQ deadline.

Actions Required to Complete the MPA: Final SERs must be issued for all plants. The schedule for completion of each SER needs to be established, in particular for those plants for which a Technical Evaluation Report is available.

Status Updated: 9/30/82

Multi-Plant Action No. B-62

No. of Plants: 70

Title: ESF Reset Control Design Difficiency IE Bulletin 80-06

Priority: 1

Cognizant Assistant Director: G. Lainas

Cognizant Branch Chief: J. F. Stolz

Lead Engineer: Sydney Miner

Lead Technical Review Branch ICSB

Other Review Branches:

Problem:

Certain equipment would return to its normal mode following the reset of an ESF signal. This protective action of the affected systems could be compromised once the associated actuation signal is reset.

Background:

On March 13, 1980, the Office of Inspection and Enforcement issued Bulletin 80-06, "Engineered Safety Feature (ESF) Reset Controls," to address the concern that the use of reset pushbuttons alone could permit certain engineered safety feature systems components to revert to the normal state following safety system actuation. The bulletin specified actions to be taken by licensee to address these concerns. By Task Interface Agreement, ROI 80-15, the Office of Nuclear Reactor Regulation was assigned responsibility for evaluating the licensee's responses to the Bulletin.

Current Status:

1. Acceptance Criteria
   Unless an alternative is justified by the licensee and the justification is acceptable, upon reset of ESF signals all affected equipment shall remain in its emergency mode. If there is multiple sequencing, none of the reset actions shall cause the affected equipment to deviate from its emergency mode.
2. Important Schedule Considerations
   33 SER's were completed last FY. 5 SERs remain to be completed this year. 33 licensing actions were completed last fiscal year. Six licensing actions remain to be completed this year.

3. Identification and Role of the Contractors
   The detailed technical review of the licensees responses to I&E Bulletin 80-06 was performed by EG&G's Sam Ramon under DL's technical assistance contract with Lawrence Livermore National Laboratory. EG&G has completed their effort on this MPA.

Required to Complete MPA:

1. EG&G complete review and issue TER	0 actions
2. Review TER and issue SER	5 actions
3. Issue SER to licensees	6 actions

Status Updated: 9/30/82

Multiplant Action Number B-63

Title Emergency Procedures and Training for Station Blackout

Lead Project Manager Chris Nelson

Priority High

Technical Review Branch(es) ORB #3

Statement of Problem:

All plants are required to implement emergency procedures and training for station blackout events (loss of all onsite and offsite ac power)

Background:

ASLAB (ALAB-603) concluded that station blackout should be considered a design basis event for St. Lucie 2.

NRC staff currently assessing station blackout on a generic basis (USI A-44)

Station Blackout procedures and training determined advisable action prior to completing A-44.

Current Status:

Generic letter 81-04 sent 2-25-81 requesting all plants (except St. Lucie 1&2) implement emergency procedures and training.

All but three plants have indicated procedures and training will be implemented on an acceptable schedule.

Actions Required to Complete the MPA:

Letters must be sent to 2 plants requesting information

Response from one plant must be evaluated

Status Updated:

June 21, 1982

Multiplant Action No. B-65

No. of Plants: All BWRs (execpt LACBWR)- 23

Title: Safety Concerns Associated with Pipe Breaks in BWR Scram System

Lead Project Manager: K. Eccleston

Priority: High

Lead Technical Review Branch: ORAB

Other Review Branches: ASB, PTR, EQB, RAB, AEB, RRAB, CSB, RSB, ORB#2, ICSB, OLB, SPE

Statement of Problem:

Assess the overall risk to long-term core cooling from postulated pipe break in Scram Discharge Volume; investigate the mitigation capability for the postulated event; establish generic recommendations for correcting any deficiencies identified.

Background:

Draft NUREG-0785 issued April 3, 1981 by AEOD described certain safety concerns associated with postulated pipe breaks in the BWR Scram System. NRC letter dated April 10, 1981 to all BWR licensees requested a generic evaluation of the concerns within 45 days and a plant specific review within 120 days. The generic evaluation was submitted by GE on behalf of the BWR owners by letter dated April 30, 1981.

Current Status:

NUREG-0803 was issued to BWR licensees and applicants on 8/31/81. Plant specific licensee responses to concerns identified in this NUREG are being evaluated.

Action Required to Complete the MPA:

Review licensee's plant specific responses to the guidance contained in NUREG-0803.

Status updated: 9/30/82

Multiplant Action Number B-66

Title Natural Circulation Cooldown

Lead Project Manager Ken Heitner

Priority Medium

Technical Review Branch(es) RSB (N. Lauben, M. E. Keane)

Statement of Problem:

All PWRs must review plant cooldown on natural circulation to determine if voiding will occur in the reactor vessel.

Background:

St. Lucie Unit 1, while cooling down on natural circulation due to a component cooling water malfunction, developed a steam space in the upper head of the reactor vessel.

Core cooling was not lost however complex situation deemed on undesirable challenge to the operator.

Current Status:

Generic letter 81-21, issued May 5, 1981, requested:

1. demonstration that natural circulation cooldown by procedure should not result in reactor vessel voiding
2. verification that supples of condensate grade aux feedwater are sufficient
3. aspects of training and procedures dealing with this subject

All licensees have responded

Westinghouse Owners Group Generic Report (OG-57) dated 4-20-81

Plant specific leadcase for St. Lucie is in review.

Actions Required to Complete the MPA:

Review all responses as well as Generic Westinghouse Report

44 actions remain-all scheduled for FY83

Status Updated:

9/30/82

FORMAT FOR MPA STATUS SHEETS

Multiplant Action Number B-67

Title Pressurized Thermal Shock to Reactor Pressure Vessels

Lead Project Manager Guy S. Vissing

Priority 1

Technical Review Branch(es) ORAB, MTEB, RSB, CPB, PTRB, GIB, RRAB

Statement of Problem:

Concerns a possibility that in PWRs pressure vessels could be subjected to severe overcooling transients followed by repressurization which could threaten the integrity of the RPVs.

Background: Pressure vessel thermal shock has been considered for many years in the context of assuring integrity in the vessel when subjected to cold emergency core cooling water during a large LOCA. Based on fracture mechanics analyses verified by enforcements, it was concluded that a postulated flow would not propagate through the vessel wall during a large LOCA. As a result of operating experience it was subsequently recognized that there could be transients in PWRs in which the vessel could be subjected to severe overcooling (thermal shock) followed by repressurization. In these pressurized thermal shock (PTS) transients, vessels could be subjected to pressure stresses superimposed upon the thermal stresses resulting from the temperature differences across the vessel wall. By letter dated April 20, 1981, we requested the PWR Owners Groups to address this problem and the licensees of operating PWRs to provide a response.

On the basis of our review of the PWR Owners Groups' responses and the PWR licensees' responses to our letter of April 20, 1981, and on the basis of our independent analysis, we determined that all operating plants could survive a severe overcooling event for **at least another year of full power** operation. However, for plants where neutron irradiation has significantly reduced the fracture toughness of the reactor pressure vessels (RPV), we decided that action should be taken to resolve the long term problems. Accordingly, under 10 CFR 50.54(f), by letter dated August 21, 1981 we requested from licensees of eight plants (based on the reference temperatures of the RPV and system characteristics), information concerning the issue of PTS to RPV. Specifically we requested within 60 days information related to: (1) the Reference Temperature for Nil Ductility Transition (RT_{NDT}) for the RPV and (2) operator action to prevent pressurized thermal shock and ensure vessel integrity. Also, we requested within 150 days information which would define actions and schedules for resolution of the PTS issue and analyses to support continued operation.

The eight plants selected were: Fort Calhoun, Robinson 2, San Onofre 1, Maine Yankee, Oconee 1, Turkey Point 4, Calvert Cliffs 1 and Three Mile Island 1.

By Commission Paper SECY 81-687 dated December 8, 1981, PTS was designated as an Unresolved Safety Issue. However, at the Commission briefing of November 24, 1981, we committed to having a staff position by Summer 1982 and by memorandum dated November 24, 1981 (Harold Denton to D. Eisenhut and S. Hanauer) Harold Denton directed that for those plants of immediate concern DL should manage the development of a short term resolution which can meet the scheduled committed to the Commission (Summer 1982).

Current Status:
The "60 day" and 150 day responses have been received for all plants except TMI-1. GPU will be submitting their 150 day response by the end of June 1982. The responses are under review in addition to supplemental information provided as a result of the Staff's meeting with industry representatives of June 9, 1982. A staff position is being formulated and a staff report to the Commission is being prepared.

Action Required to Complete MPA:
Our input is being prepared with appendices which will address evaluation and recommendation for each plant. The distribution of the report and the type of action which will follow will evolve after the staff's presentation to the Commission.

Multi-Plant Action No. B-69

Title: PWR Main Steam Line Break with Continued Feedwater Addition

Priority: High (IE Bulletin 80-04)

Lead Project Manager: Ed Tourigny

Lead Technical Review Branch: CSB/DSI

Other Review Branches: RSB, ICSB/DSI

Problem:

A licensee submitted a report to NRC identifying a deficiency in the original main steam line break (MSLB) analysis for their plant. They determined that, if the auxiliary feedwater system continued to supply feedwater at runout conditions to the affected steam generator, containment design pressure would be exceeded in about 10 minutes. The long term effect of the water supplied by the auxiliary feedwater system also had not been considered in prior analyses.

Background:

Virginia Electric and Power Company (VEPCO) submitted a report to the Nuclear Regulatory Commission (NRC) dated September 7, 1979 identifying a deficiency in the original main steam line break (MSLB) analysis for North Anna Power Station, Units 3 and 4. Stone and Webster Engineering Corporation re-analyzed the containment pressure response following a MSLB and determined that, if the auxiliary feedwater system continued to supply feedwater at runout conditions to the affected steam generator, containment design pressure would be exceeded in about 10 minutes. The long term effect of the water supplied by the auxiliary feedwater system had not been considered in prior analyses.

On October 1, 1971, IE Information Notice No. 79-24 was sent to all holders of operating licenses and construction permits, informing them of VEPCO's finding. The Consumer Power Company of Michigan (Palisades, Unit 1 facility) conducted an accident analysis review pursuant to the Information Notice and found that with offsite power available, the condensate pumps would feed the affected steam generator at an excessive rate. This was not considered in their analysis of the MSLB accident.

Multiplant Action Number: C-07

Title: Fuel Handling Accident Inside Containment

Lead Project Manager: J. Lombardo

Priority: 2

Technical Review Branch(es):

Statement of Problem:

By letter dated January 3, 1977 to Commissioner Gilinsky, Mr. Robert Pollard recommended that NRR review the potential consequences of a postulated fuel handling accident at each operating plant because this accident had not been considered during licensing of the plants.

Background:

Letters were sent to licensees of 39 operating plants in January 1977 requesting that they provide a detailed evaluation of the potential consequences of this accident. Letters were not sent to licensees of 24 operating plants because this accident had been evaluated in their SER.

Current Status:

There are 4* plants which are not complete. The issues range from concerns regarding X/Q to acceptability of filers.

Action Required to Complete the MPA:

The project managers are pursuing resolution of the remaining issues.

*Surry 1/2, Maine Yankee, Indian Point 2

Status Updated: 9/30/82

Multi-Plant Action No. C-10

No. of Plants: 54

Title: Control of Heavy Loads at Nuclear Power Plants

Priority: Phase I, High; Phase II, Medium

Cognizant Assistant Director: Tom Novak

Cognizant Branch Chief: Robert A. Clark

Lead Engineer: Glode Requa

Lead Technical Review Branch: Auxiliary Systems Branch

Other Review Branches: None

Problem: Dropped Heavy Loads may impact spent fuel, fuel in the core, or equipment that may be required to achieve safe shutdown and continued decay heat removal for PWRs and BWRs. If sufficient spent fuel or fuel in the core were damaged and if the fuel is highly radioactive, the potential releases of radioactive material could result in off-site doses that exceed 10 CFR Part 100 limits.

Background: USI - Task A-36 was established to examine staff licensing criteria, the adequacy of measures in effect at operating plants, and to recommend necessary changes to assure the safe handling of Heavy Loads. NUREG-0612 provides the results of the review and includes the task groups recommendation.

Current Status:

1. NUREG-0612 was issued to all licensees by letter dated December 22, 1980. The letter requested: interim actions to be completed in 90 days, a Phase I Action (report, confirmation and justification) in six months and Phase II (specific requirements) in nine months.

2. The criteria contained in NUREG-0612 is used for the acceptance criteria. The contractor is Franklin Research Center (FRC). FRC provides the TER's to the lead technical group ASB. Schedules were established to provide 59 TER's to DL for FY82 from the contractor for Phase I only.

3. Initial responses from the licensees have been very slow partially because detailed information required necessitated archival searches by previous lifting equipment suppliers and outdated equipment standards had to be compared with current standards for possible equipment upgrading as well as the complexity of information required was more than expected.

4. Draft TER's (requests for additional information) have been sent to all licensees except Kewaunee. Kewaunee has not yet satisfactorily responded to Phase I. Kewaunee's response is targeted for 11/15/82.

5. The licensees' have been slow in providing their initial responses and additional information on open items which has delayed the originally scheduled 59 TER's to DL in FY82.

6. The lead Project Manager has issued guidance and requested certain actions to be taken in memoranda dated January 15, 1982, April 26, 1982, and October 22, 1982, to all ORB Chiefs.

Actions Required to Complete C-10 Licensing Actions:

1. Project Managers expedite licensees for information necessary to close out open items as discussed in the April 26 and October 22, 1982 memoranda to all ORB Chiefs.

2. Contractor/ASB review open item submittals, prepare and issue final TER to DL:

18 TERs FY83	53 TERs FY84

Status Updated: 9/30/82

Multiplant Action Number C-11

Title: Reactor Protection System (RPS) Power Supplies

Lead Project Manager: J. Van Vliet

Priority:

Technical Review Branch: PSB

Statement of Problem:

Design deficiencies have been identified in the BWR RPS MG set regulatory systems that could adversely affect the operability of the RPS if (1) a sequence of undetected single component failures were to occur or (2) a seismic event occurred that resulted in the postulated component malfunctions.

Background:

The design deficiency was first identified during the Hatch 2 licensing process. By letter dated August 7, 1978 the other BWRs were directed to review their designs and submit a report. That letter also directed that a surveillance program be implemented. By letter dated September 24, 1980 the licensees were requested to: (1) commit to installing a Class IE system, (2) provide a schedule for completion of the modification, and (3) provide a schedule for submitting design information and proposed Technical Specifications. All licensees responded satisfactorily.

Current Status

LLNL is writing TERs based on licensee submittals. PSB is writing SERs. Five reviews have been completed. Four installations are complete. All licensees except Browns Ferry are proposing modification installation prior to the end of 1983. Browns Ferry proposes an integrated schedule with modification installation in late 1984. No unresolved technical issues exist for this tiem.

Actions Required to Complete the MPA:

1. Review licensee's designs (post-implementation)
2. Review licensee's proposed TS changes
3. Issue license amendment that revises TS

Status Updated: 9/30/82

Because of the deficiencies that were identified in the original MSLB analyses, IE Bulletin No. 80-04 was issued on February 8, 1980. The IE Bulletin requested licensees and certain applicants of PWR facilities to assess the effect of continued feedwater or condensate addition on the containment response and reactor core reactivity response to a MSLB accident. The IE Bulletin was sent to all licensed PWR facilities and to those PWR facilities nearing licensing (Diablo Canyon, McGuire, North Anna 2, Salem 2, and Sequoyah).

Current Status:

As of May 1, 1981, 46 PWR licensees have responded to IE Bulletin 80-04. On August 17, 1981, Franklin Research Center was authorized to begin work reviewing the responses to IE Bulletin 80-04. As of April 16, 1982, Franklin Research Center concluded that some licensee submittals did not provide adequate information for them to complete their review; licensees are being requested to provide the additional information. As of 10/22/82, twenty-nine reviews and their associated licensing actions were completed. This assignment is expected to be completed by the contractor by December 31, 1982.

Action(s) Required to Complete the Licensing Action:

1) Review licensees' responses to IE Bulletin 80-04.
2) Evaluate licensees' responses.
3) Evaluate licensees' corrective actions.
4) Issue Safety Evaluation Report on licensees' responses and corrective actions.

Updated: 9/30/82

Multi-Plant Action No. C-01
Title: PWR Secondary Water Chemistry
Lead Project Manager: M. Grotenhuis
Priority: 2
Technical Review Branch(es): ChEB

Statement of Problem:

PWR facilities only are affected. The NRC staff's testimony at the January 1976 Prairie Island public hearings on steam generator tube integrity set forth the regulatory position regarding secondary water chemistry monitoring requirements. The NRC position is that monitoring requirements are needed to assure control of harmful impurity buildup in the steam generator that could cause tube corrosion and impair tube integrity.

Background:

Letters were sent to PWRs requesting Technical Specifications changes to incorporate Secondary Water Chemistry monitoring requirements; a number of licensees objected to this approach on the basis of potential limitations to plant operating flexibility. NRC changed its position and requested a license condition that requires the implementation of a secondary water chemistry monitoring and control program containing appropritae procedures and administrative controls.

Current Status:

Five plants remain to be closed out. Many facilities were resolved by ORPM's owing to a lack of Technical Review priority in the post TMI period. Recent scheduling of tasks inside the NRC has made Technical Review capacity again available enabling planning for a relatively early completion.

A contractor is now involved; this is Brookhaven National Laboratories. All actions are scheduled for completion this fiscal year.

Action(s) Required to Complete the MPA:

These requests have been sent to the five licensees and we are awaiting the responses.

Status Updated: 9/30/82

Multiplant Action Number C-04

Title ESF Filter Tech. Specs.

Lead Project Manager J. Lombardo

PRIORITY 3

Technical Review Branch (es) ETSB

Statement of Problem:

Some licensee have not submitted T. S. Regarding ESF filters which comply with the position of RG 1.52

Background:

Letters sent out in 1976-1977 to all licensees. Most have been completed.

Current Status:

3 *plants are outstanding. All T. S. to be issued by 12/82.

Actions Required to Complete the MPA:

Awaiting Submittal. Project Managers are pursuing

*Surry 1/2, Palisades

Status Updated 9/30/82

Multiplant Action Number: C-06 - INACTIVE

Title: Pump Support - Lamellar Tearing

Leak Project Manager: R. Emch

Priority: 2

Technical Review Branch: GIB

Statement of Problem:

The potential for low fracture toughness and lamellar tearing on steam generators (including vessel, pressurizer and torus supports) exists due to variability in fracture toughness and resistance to corrosion of support materials.

Background:

Was unresolved safety issue A-12. Additional complication is that supports other than integrally welded are not covered in ASME Code and GDC and may require rule-making. Resolution of issue will occur with issuance of the "Final" NUREG-0577 in early 1982.

Current Status:

1. Acceptance criteria will be provided in NUREG-0577
2. No schedule has been set.
3. GIB/DST (Dick Johnson) has responsibility; however, 6 plants (Indian Point 2/3, San Onofre 1, Turkey Point 3/4, and Arkansas 2) will be reviewed under FRC contract (Bill Koo). These plants did not provide adequate information originally. Preliminary reviews have been completed on these 6 plants, but the detailed review is waiting for guidance of NUREG-0577.
4. In early 1982, C-06 was removed from the list of active multiplant actions. At that time, DL concluded that this issue was not ready for implementation at operating reactors since NUREG-0577 was not published in final form.

Actions Required to Complete the MPA:

Completion of NUREG-0577 is first step. Further steps to be determined based on guidance in NUREG. This MPA is in an inactive status.

Status Updated: 9/30/82

Multi-plant Action Number: C-14

Title: SEISMIC QUALIFICATION OF AUXILIARY FEEDWATER SYSTEMS

Lead Project Manager: J.T. Beard

Priority: 1

Technical Review Branch(es): ORAB
ASB

Statement of Problem

Since TMI-2, great attention has been focused on the ability of PWR's to reliably provide for shutdown decay heat removal at normal system pressure. The steam generator is the preferred and proven choice for accomplishing a safe shutdown of the plant. Therefore, the auxiliary feedwater systems (AFW) should satisfy the seismic design criteria for the Safe Shutdown Earthquake (SSE), consistent with other safety-related systems in the plant. However, only those facilities licensed recently have been reviewed against the NRC Standard Review Plan which treats the AFW as an Engineered Safety Feature.

Background

In August 1980, the NRC completed a preliminary study of the risk of a seismically induced loss of decay heat removal for plants without a seismically qualified AFW. One of the conclusions was that the increase in risk during the next three years is sufficiently small to allow plant operations to continue. Another conclusion was that plants should be surveyed to confirm the extent of the PWR plants without seismically qualified AFW.

In February 1981, the NRC developed and embarked on Multi-plant Action Plan C-14, "Seismic Qualification of Auxiliary Feedwater Systems." An objective to this plan is to increase, to the extent practicable, the capability of those plants without seismically qualified AFW to withstand earthquakes up to H. Denton dated February 20, 1981. Generic Letter 81-14 requested licensees: (1) to identify, via a walkdown of the AFW system, deficiencies ammenable to simple remedial actions, and (2) to review the plants to determine the extent and areas where significant improvements may be needed. The NRC will then take action to require licensees to make improvements such as re-analysis and/or modifications, for those plants which cannot demonstrate reasonable assurance of the functioning of the AFW system following an earthquake of SSE magnitude.

Current Status

In a Generic Letter (GL 81-14), dated February 10, 1981, the NRC requested under 10 CFR 50.54(f) that all operating PWR licensees complete AFW walkdowns and report information regarding the seismic capability of AFW. This action implemented the first phase of the C-14 program.

Lawrence Livermore National Laboratory under technical assistance contract FIN A-0429 is reviewing and evaluating the licensees' responses to GL 81-14. Of the 47 PWRs involved with this MPA, LLNL has found it necessary so far to generate Requests for Additional Information for over 40 plants, in order to correct deficiencies in licensees' responses or to obtain technical clarification of the licensees' responses.

In FY81, 2 TACS were completed. In FY82, 20 TACS were completed.

Actions Required to Complete the MPA

Twenty-five plant TACS remain active. LLNL is reviewing licensees' responses to Requests for Additional Information. The objective is to verify that AFW system walk downs were conducted and deficiencies identified, to report the level of seismic qualification of each area of the AFW, and to identify plants for which significant re-analysis and/or modifications may be needed. The results of this evaluation are to be reported both on a per plant basis and in a summary form for all the plants involved.

It is anticipated that LLNL can complete the plant-specific evaluations by 10/30/82 and the project summary report during the second quarter of FY83.

Status Update

9/30/82

Multi-Plant Action No.: D-01

No. of Plants: 22

Title: Mark I Containment Program

Priority: 1

Cognizant Branch Chief: D. Vassallo

Lead Engineer: B. Siegel

Lead Technical Review Branch: CSB-Load Audit Review
DRAB-Structural Audit Review

Other Review Branches: RSB, MTEB, RRAB, ICSB

Problem:

Since the original design of the Mark I containment system additional loading conditions resulting from the dynamic effects of drywell air and steam being rapidly furled into the suppression pool during a postulated LOCA and from suppression pool response to SRV operation generally associated plant transient operating conditions have been identified, the objective of this program is to restore the originally intended design safety margins for each Mark I containment system.

Background:

A Mark I Owners Group (OG) with GE the lead technical organization was formed to quantify the dyrodynamic loads and assess the effects of these loads on the Mark I containment structure. The OG divided this task into a short term (STP) and long term program (LTP).

The objectives of the STP were to verify that each Mark I containment system would maintain its integrity and functional capapability when subjected to the most probable loads induced by a postulated design-basis LOCA, and to verify that licensed Mark I BWR facilities would continue to operate safety, without endangering the health and safety of the public, while a methodical, comprehensive LTP was being conducted. The staff in the "Mark I Containment Short-Term Program Safety Evaluation Report," NUREG-0408 concluded that sufficient margin of safety had been demonstrated to assure the functional performance of the containment system and, therefore, any undue risk to the health and safety of the public was precluded.

The objectives of the LTP were to establish design-basis loads that are appropriate for the anticipated life of each Mark I BWR facility (40 years), and to restore the originally intended design-safety margins for each Mark I containment system. The principle thrust of this program has been the development of generic methods for the definition of suppression pool hydrodynamic loading events and the associated structural assessment techniques for the Mark I configuration. The generic anslysis techniques are intended to be

used to perform a plant-unique analysis (PUA) for each Mark I facility. The staff in the "Mark I Containment Long-Term Program Safety Evaluation Report," NUREG-0661 concluded that the load definition procedures utilized by the BWR Owner Group, as modidied by the staff's requirements provide conservative estimates of these loading conditions and that the structural acceptance criteria are consistent with the requirements of the applicable codes and standards.

Current Status:

The licensees are in the process of performing PUA and designing and installing modifications to meet the Commission's Order date for each operating plant. Based on the staff's review of the Mark I Owners Group June 29, 1981 submittal the staff prepared a Commission Paper (SECY-81-678) requesting Commission approval for extension of the exemptions and completion dates for plant modifications needed to comply with the staff's acceptance criteria contained in Appendix A to NUREG-0661. Commission approval was received on January 8, 1982 Orders extending the exemptions and completion dates were sent out to 21 of the 22 operating reactors (Cooper Nuclear Station will meet the existing Order date and therefore did not require an extension). The licensees are in the process of preparing plant-unique analysis for staff review. Plant unique analyses reports have been received from three of the fifteen licensees. Technical assistance contracts have been awarded to Franklin Research Center and Brookhaven National Laboratory to perform an audit review of the licensee's PUA. Lead technical review responsibility for the BNL load audit review has been transfered to CSB.

Actions Required to Complete the Licensing Action:

1) Submittal of the PUA to the NRC
2) Post implementation audit of PUA by Franklin Institute and BNL on Technical Assistance Contracts
3) Issuance of SER to each licensee on acceptability of Mark I LTP modifications and analyses for their plant.
4) Technical Specification changes resulting from Mark I Modifications

Status Updated: 9/30/82

Multiplant Action Number D-04

Title PWR Reactor Vessel Cavity Seal Ring Missile Potential.

Lead Project Manager Charles Trammell

Priority 2

Technical Review Branch(es) ORB #3

Statement of Problem:

The reactor vessel cavity seal ring can become a missile if left in place during operation should a LOCA occur in or near the reactor vessel cavity.

Background:

Trojan disclosed this as a possible problem via an LER. On 2/2/78, letters were sent to all PWR licensees requesting a solution by either (a) removing the seal ring during operation or (b) confirming by analysis that the seal ring can withstand blowdown forces.

Current Status:

38 plants-completed.

4 plants-remain to be completed:

Haddam Neck

San Onofre 1

Surry 1

Surry 2

The remaining 4 plants have submitted "leak-before-break" analyses in response to MPA D-10, "Asymmetric LOCA Loads." It is expected that NRC will accept this analysis. If so, this will also solve D-4 for these plants, since the seal ring will not become a missile under "leak" conditions.

Actions Required to Complete the MPA:

The resolution of the 4 remaining plants (identified above) is dependent on the resolution of D-10 as described above.

Status Updated:

9/30/82

Multi-Plant Action No. D-05
Title: Plant UPI Model Problem
Lead Project Manager: M. Grotenhuis
Priority: 3
Technical Review Branch: RSB

Statement of Problem:

Only 2 loop PWR's are affected. All Westinghouse (W) 2 loop plants have a Low Pressure Safety Injection System (LPSI) which injects water directly into the Upper Plenum of the Reactor Vessel (UPI). This is used to counter the consequences of a single failure for 2 loop units.

However, the currently approved ECCS evaluation models for two loop plants are based on an ECCS system in which LPSI is directly to the cold leg of the Reactor Coolant System and because of this may be considered as not meeting the requirements of 10 CFR Appendix K Section II.5.

Background:

This has been an outstanding issue for two loop plants since the implementation of Regulations for an approved ECCS system. The issue became a MPA during late 1977 and 1978 when an "interim" model was developed to review the potential effect of UPI against the conventional model.

Current Status:

Six facilities are affected. W 2 loop UPI plants are presently operating on the bases of a number of approaches being taken to determine allowable peaking coefficients in an interim manner.

Acceptable long term resolution involves development of satisfactory generic models with plant specific application. Both W and Exxon fuels are involved.

A contractor has been assigned to the review of proposed models to develop acceptable generic resolutions.

Plant specific reviews are proposed for fiscal year 1983.

Action(s) Required to Complete the MPA:

Generic models must be reviewed and approved for Westinghouse and Exxon.

Plant specific models must be approved for the six facilities.

Status Updated: 9/30/82

Multiplant Action Number: D-10

Title: Asymmetric LOCA Loads on Primary Reactor Coolant System

Lead Project Manager: J. Shea

Priority: Medium

Technical Review Branch(es): MEB, MTEB, CPB, CSB

Statement of Problem:

Asymmetric loads resulting from rupture of the primary piping could potentially damage reactor vessel support internals and other primary system components. Damage to the reactor internals could impair core coolability.

Background:

In January 1978, all pressurized water reactor (PWR) licensees were required by the NRC to provide an assessment of the adequacy of their reactor vessel supports and other affected structures to withstand combinations of responses to asymmetric loss-of-coolant accident (LOCA) loads and the Safe Shutdown Earthquake (SSE). This potential safety problem was subsequently identified as an unresolved safety issue Task Action Plan A-2.

Current Status:

All PWR plant assessments for asymmetric loads have been received and are currently being evaluated by staff and contractor EG&G. As a basis for this evaluation, staff is implementing criteria developed as part of the Task Action Plan A-2. These criteria are included in NUREG-0609. Concurrently, some PWR licensees have performed a study of "leak before break". Staff approval of the "leak before break" concept is expected in December 1982.

Action Required to Complete the Licensing Action:

Complete evaluation of Owners Group submittals including Westinghouse Owners Group proposed "leak before break" concept and plant specific submittals and issue SER.

Status Updated: 9/30/82

Multiplant Action Number: D-12

Title: BWR Non Jet Pump Core Spray Performance

Lead Project Manager: P. J. Polk

Priority: 3

Technical Review Branch: ORAB

Statement of Problem:

Core Spray System nozzle coverage differs in a steam environment vis-a-vis an atmospheric environment. The original design is based on atmospheric analyses and tests. The generic issue requires that nozzle coverage be reanalyzed to reflect the steam environment.

Background:

History is inappropriate since only one plant remains outstanding.

Current Status:

All non-Jet Pump BWRs have either made the necessary modifications or committed to same with the exception of Nine Mile Point.

ORAB is presently reviewing the Nine Mile Point submittal in which the licensees concludes that modification of spray nozzles is not required.

Action Required to Complete the MPA:

The Oyster Creek and Nine Mile submittals are currently under review.

Status Updated: 9/30/82

Multi-Plant Action No. D-15

No. of Plants: 70

Title: High Energy Line Break and Consequential System Failure

Priority: 3

Cognizant Assistant Director: T. M. Novak

Cognizant Branch Chief: S. A. Varga

Lead Engineer: M. Grotenhuis

Lead Technical Review Branch EQB, RRAB, GIB

Other Review Branches: ____________________

Problem: Certain non-safety grade equipment, if subjected to an adverse environment, could impact the safety analyses and the adequacy of the protective functions performed by safety grade equipment. The NRC is concerned that a potential may exist at operating light water reactor facilities, for an unreviewed safety matter related to the effects of the environment on control systems resulting from high energy line breaks inside or outside containment and the results of these effects on the required safety systems.

Background:
On September 17, 1979, the NRC requested that all LWR licensees review their plants to determine whether control system failures caused by high energy line breaks (HELB) could result in consequences more severe than previously analyzed for the HELB. All licensees responded in a timely manner (20 days). A status reported from D. G. Eisenhut to H. Denton dated October 15. 1979 provided a basis for continuing operation. A meeting with representatives of the nuclear industry was held on November 9, 1979. A status report P. S. Check to D. G. Eisenhut dated December 19, 1979 stated that the NRC task group had found no specific identified safety problems. There were remaining concerns which fall within the scope of NUREG-0660 II.C.3.

Current Status:

All TAC's issued on this subject are still open. A memo has been prepared which includes instructions to PM's to close the issue and sent a letter to each utility informing them that any continuing effort by the staff will be under NUREG-0660 II.C.3.

Actions Required to Complete the MPA:

D. Eisenhut has received the above memo and has requested a meeting with R. Mattson and S. Hanauer on the matter. Following this each PM would receive the above instructions.

Status Updated: 9/30/82

Multiplant Action No.: D-17

Title: Definition of Operable

Lead Project Manager: Sydney Miner

Priority Medium

Technical Review Branch(es): None

Statement of Problem:

Clarification of the term "OPERABLE" as it applies to support system outages or multiple outages of redundant components.

Background:

In a letter dated April 10, 1980, an explanation of the problem plus accompanying illustrate examples of recommended changes contained in the associated bases, were delineated to all licensees. The licensees were required to submit proposed changes to tech specs applicable to their plant and to implement procedures designed to assure compliance with the specifications containing new requirements.

Current Status:

1. Acceptance Criteria
   The acceptance criteria that LCO should be incorporated in the Technical Specification which requires that the plants be in cold shutdown within 36 to 39 hours if redundant ECCS loops become inoperable either due to failures in redundant ECCS loops or the diesel generators.

2. Important Schedule Considerations
   Five licensing actions were completed last fiscal year. All the remainder are scheduled to be completed this year.
3. Review Responsibilities
   This MPA is being handled completely within the Project Management Organization.

Actions Required to Complete MPA:

1. Remaining Milestones

   (a) Approval of remaining changes to the Technical Specifications of the remaining plants.

   (b) Issuance of the SER and the License Amendments.

2. Plant Actions Remaining

   There are 16 remaining licensing actions.

Status Updated: 9/30/82

Multiplant Action Number: E-04

Title: BWR Single Loop Operating

Lead Project Manager: Dick Clark

Priority: Low

Technical Review Branches: RSB, CPB

Statement of Problem:

The standard BWR Technical Specifications do not permit a plant with two recirculation loops to operate either with one loop or in the natural circulation mode. Fifteen operating BWRs have requested approval to operate at reduced power levels with a single loop if problems develop with a jet pumb, valve, seals, flow controller, etc., in the other loop. Most of the potential safety reviews can more appropriately be resolved on a generic basis.

Background

Single loop operation at limited power levels had previously been authorized for 6 BWRs for short periods of time (one week to two months). Based on this operating experience, the staff has concluded that BWRs can be safely operated at 50% power by natural circulation (i.e., without forced flow from any recirculation loop). Accordingly, as an interim measure, for those licensees who modified their application, the plants have been authorized to operate, if necessary, at power levels of 50% with a single recirculation loop. For operation above 60% power, there is a generic concern involving flow stability when operating with one rather than two recirculation loops.

Current Status:

A meeting was held October 22, 1981 with all BWR licensees and GE to discuss GE's evaluation of Browns Ferry's and other BWR operating expericnce with single loop operation. RSB and CPB have prepared a draft list of questions which we discussed in a meeting with GE on January 21, 1982. Pending resolution of the generic concersn on thermal hydraulic stability, the review of applications for single loop operation at power levels above 50% is on hold. The review of applications for operating at 50% power has been completed on six applications and is nearing completion on the other nine applications.

Actions Required to Complete the Licensing Action:

Complete reviews on applications for single loop operation at 50% power. For those licensees requesting approval to operate on a single loop at power levels greater than 50%, transmit requests for additional information to licensees. Review and evaluate responses. Prepare safety evaluations authorizing plants to operate on a single loop at power levels indicated by the revised ECCS analysis.

Status Updated: 9/30/82

Multi-Plant Action No. E-05
No. of Plants: 3
Title: Westinghouse N-1 Loop Operation
Priority: Low
Cognizant Assistant Director: G. C. Lainas
Cognizant Branch Chief: S. Varga
Lead Engineer: D. Wigginton
Lead Technical Review Branch: RSB
Other Review Branches: ICSB

Problem:

All Westinghouse plants have a provision in their license that prohibits operation with less than all loops (N) in service.

Background:

It may be desirable to operate plants with one loop out of service. Present restrictions in the license do not permit this type of operation.

Current Status:

Only three Westinghouse plants, Beaver Valley and Zion (1 and 2), have submitted proposed amendments for N-1 loop operation. Beaver Valley is lead plant and most of the review has been completed. Trojan, a plant without loop isolation valves, has expressed an interest in submitting an application.

Action(s) Required to Complete the Licensing Action:

NRC to review contractor (Franklin Inst., Lawrence Livermore) inputs and write SER on Beaver Valley. Zion review to follow. Other Westinghouse pLants will probably submit similar applications if Beaver Valley is approved.

OPERATING REACTORS LICENSING ACTIONS SUMMARY

Date Completed: November 1982
Date Published: November 1982

Prepared for: OFFICE OF NUCLEAR REACTOR REGULATION

Prepared by: OFFICE OF RESOURCE MANAGEMENT
U.S. NUCLEAR REGULATORY COMMISSION
WASHINGTON, D.C. 20555

FOREWORD

THE OPERATING REACTORS LICENSING ACTIONS SUMMARY IS DESIGNED TO PROVIDE THE MANAGEMENT OF THE NUCLEAR REGULATORY COMMISSION (NRC) WITH AN OVERVIEW OF LICENSING ACTIONS DEALING WITH OPERATING POWER AND NONPOWER REACTORS. THESE REPORTS UTILIZE DATA COLLECTED FROM THE DIVISION OF LICENSING IN THE OFFICE OF NUCLEAR REACTOR REGULATION AND ARE PREPARED BY THE OFFICE OF MANAGEMENT AND PROGRAM ANALYSIS.

THIS SUMMARY REPORT IS PUBLISHED PRIMARILY FOR INTERNAL NRC USE IN MANAGING THE OPERATING REACTORS LICENSING ACTIONS PROGRAM. ITS CONTENT WILL CHANGE BASED ON NRC MANAGEMENT INFORMATIONAL REQUIREMENTS.

TABLE OF CONTENTS

Definitions I-III

Section 1 Management Overview Report

A. Plot of Total Active Routine Actions by Month A1
B. Plot of New Actions by Month B1
C. Plot of Completed Actions by Month C1-C2
D. Routine Licensing Actions by Month D1-D2
E. Routine Licensing Actions - Power Reactors E1-E3
F. Routine Licensing Actions - Nonpower Reactors F1-F2
G. Manpower Summary by Facility G1-G3
H. Multi-Plant Issues Summary Report H1-H4
I. Multiplant Actions - Lead Assignments and Contract Information I1-I12
J. Operating Reactors Hearing Summary J1-J5
K. Completed Licensing Actions by Fee Class K1
L. FY to Date Multi-Plant Specific Action Summary L1
M. Multiplant Action Completion Schedule M1-M7
N. Requests for NRR Assistance - Status Report N1-N7

Section 2 TMI Licensing Actions

A. Plot of Total Active TMI Actions by Month A1
B. Plot of New TMI Actions by Month B1

C. Plot of Completed TMI Actions by Month C1
D. TMI Licensing Actions by Month D1-D2
E. TMI Power Reactors Licensing Actions E1-E3
F. Status of NUREG-0737 Requirements Schedule F1-F13
G. NRR Implementation Review Completion Status G-1

Section 3 Licensing Action by Power Reactor Condensed Management Report 1-146

Section 4 Multiplant Action Descriptions for Active Issues

Definitions

I. Licensing Actions

- A. Active Licensing Action - an item which has been initiated but not completed.
    - 1. Multi-Plant Licensing Action - a licensing action topic that applies to a class of reactors.
    - 2. Plant Specific Licensing Action - a licensing action associated with a certain facility because of the uniqueness of the technical specifications or situation, e.g., reduce the number of incore detectors.
- B. Types of Licensing Actions
    - 1. Amendment - action that results in changes to facility licenses including technical specification changes.
    - 2. Letters to Licensees - letters sent to licensee requesting information that will resolve or aid in the resolution of technical issues. Examples of letters sent to licensees are: fuel handling inside containment, assymmetric loads or reactor vessel materials surveillance.
    - 3. Orders/Exemptions - actions on operating plant that result in an Order for Modification of a License or an exemption to the regulation.
- C. Categories of Multiplant Actions
    - 1. Regulation - actions directly attributed to a specific regulation requirements, e.g., inservice inspection/testing requirements 10 CFR 50.55a(g).(A-Series)
    - 2. Operating Experience - action directly attributed to an occurrence of accumulative experience at licensed reactors e.g., fire protection. (B-Series)
    - 3. Internal Review - action resulting from NRC staff reviews of license applications, generic topics and operating reactor licensing actions, e.g., reporting requirements, fuel handling accidents, or filter tech spec requirements. (C-Series)

4. New Information - action required as a result of current data which shows that previously accepted requirements are no longer acceptable or are overly restrictive, e.g., ECCS input errors, assymmetric loads, equipment qualification. This new information may result from technological advancements, research or advanced analytical studies. (D-Series)
5. Licensee Requests - action requested by the licensee that does not fit any of the other sources of licensing actions. Usually these actions are requested because of the licensee's desire to improve operational performance, e.g., core reloads, spent fuel pool modifications, or (N-1) loop operation. (E-Series)
6. TMI Related Actions - actions related to the TMI Action Plan. (F-Series)

II. Significant Dates

A. Initiation - This is the date an action was actually started or implementation was begun on a plant. It is the date that a letter was issued to the licensee initiating the action, the date of an amendment request, or the date a TAC was issued for an item arising out of an operating experience or new information event.

B. PM-Target - project manater's anticipated completion date for active items.

C. Licensing Action Complete - date on which all work, both technical and administrative was completed and sent out of the agency.

III. Definition of Priorities (Applicable to Multi-Plants or Plant Specific Actions)

A. High (1)

1. Required by Rule, Order or NRC Letter
2. Safety-related items that use definite improvements in safety or would reduce the likelihood of transients or accidents.
3. Hearing-related matters.
4. High public interest in issue.
5. Actions which, if not completed, will affect power level or scheduled restart of a facility.
6. § 2.206 petitions.

6. § 2.206 petitions.

B. Medium (2)

1. Items which, if not completed could result in an otherwise unnecessary IE enforcement action.
2. Spent fuel pool expansions.
3. Task should be completed within six months.

C. Low (3)

1. Licensee requests for amendments that have low safety significance.
2. Licensee requests for amendments which may have safety significance but for which NRC action is not required during the next six months (e.g., in early submittal of a core reload).

OPERATING REACTORS HEARING SUMMARY

Status as of 9/30/82

Facility	Project Manager	Hearing Attorney	Subject	Initiation Date	Status
Big Rock Point	R. Emch	M. Karman	Mixed Oxide Fuel	8/75	In indefinite suspension as a result of GESMO decision.
Big Rock Point	R. Emch	J. Moore	Spent Fuel Pool Expansion	9/25/79	Evidentiary hearing held 6/7/82-6/12/82, which covered about 40% of the contentions. Additional evidentiary hearings have not yet been scheduled for the remaining contentions.
Browns Ferry 1/2/3	R. Clark	R. Rawson	Onsite Storage of Low Level Waste	1/81	ASLB denied petitions to intervene. Appeal Board remanded issue back to ASLB and reinstated intervenors. Staff and TVA has appealed decision to the Commission. The Commission ordered briefs to be filed by the staff and TVA by May 6, 1982. Prehearing conference held April 1, 1982 in Huntsville, AL. SER and EIA issued June 4, 1982 and June 9, 1982, respectively. Commission remanded issue back to Appeal Board.
Dresden 1	P. O'Connor	R. Rawson	Decontamination	9/30/81	First Prehearing Conference has not yet been held. Contentions remain pending.

OPERATING REACTORS HEARING SUMMARY

Facility	Project Manager	Hearing Attorney	Subject	Initiation Date	Status
GETR	C. Nelson	D. Swanson	Seismic Show Cause Issues	10/24/77	Testimony completed; awaiting Initial Decision.
Ginna	J. Lyons	M. Young	Full Term Operating License Conversion	6/8/73	Based on our meeting the following schedules we anticipate that the evidentiary hearing for the POL Conversion to FTOL will be held in the Summer of 1983. FES update, October 1982; Final SEP (Integrated Safety Assessment) Report, October 1982; Conversion SER, October 1982; and SEP/Conversion SER Supplement, late winter.
Humboldt Bay	V. Rooney	M. Young	Deletion of Seismic Conditions	7/29/77	Motion to withdraw application for license amendment and to terminate the proceeding filed by the licensee on December 31, 1980. By memorandum and order dated February 17, 1982 the ASLB ordered the licensee to file status reports each 3 months. The ASLB also ordered that 6 months after the Commission reaches a decision on safety goals and issues guidelines the licensee must report to the Board a) readiness to take actions to permit resumed operation, or b) commit to submit a decommissioning plan.
Indian Point 2/3	J. Hannon	J. Moore	Risk Assessment of Plant	10/1/82	Prehearing conference to be held November 3-4, 1982.

OPERATING REACTORS HEARING SUMMARY

Facility	Project Manager	Hearing Attorney	Subject	Initiation Date	Status
LaCrosse	R. Dudley	C. Woodhead	Full Term Operating License (with seismic considerations)	6/23/78	With respect to environmental contentions, by Memorandum and Order dated August 2, 1982, the ASLB granted staff and applicant motions for summary disposition of all intervenor's environmental contentions, the Board directed the staff to correct the FES on matters involving energy alternatives. The proceeding also involves seismic issue from Show Cause (2.206) proceeding with FTOL proceeding. The FTOL proceeding is contingent upon the completion of the SEP for the facility.
Maine Yankee	K. Heitner	J. Gutierrez	Spent Fuel Pool Capacity Expansion	9/18/79	First Prehearing Conference completed. Two intervenors admitted. April 12, 1982 ASLB Order admits 14 contentions. June 16, 1982 SER & EIS issued. ASLB Order of July 20, 1982 schedules hearing for June 7, 1983. August 30, 1982 - Additional contentions from intervenors - September 30, 1982 Applicant & staff replies to contentions & intervenors response. ASLB rulings due 10/25/82.
North Anna 1/2	L. Engle	D. Swanson	Turbine Missile Risk	2/27/78	On June 2, 1982, the ASLAB issued ALAB-676, wherein the Appeal Board delineated its decision resolving the North Anna Turbine Missile Issue. All issues in this proceeding are terminated other than the issue of radon emissions in the milling & mining of uranium fuel. The radon issue will be addressed following resolution in other hearings which are contested.

OPERATING REACTORS HEARING SUMMARY

Facility	Project Manager	Hearing Attorney	Subject	Initiation Date	Status
Palisades	T. Wambach	C. Barth	Steam Generator Repair Program	7/23/79	Prehearing Conference was held on September 21, 1982. Following this conference, the ASLB has proposed to dismiss the proceeding due to lack of interest by the intervenor.
Point Beach 1	T. Colburn	R. Bachmann	Demonstration Tube Sleeving	7/20/81	Final ASLAP decision issued 10/1/82 supporting ASLB decision.
Point Beach 1/2	T. Colburn	R. Bachmann	Steam Generator Tube Sleeving	7/20/81	Staff EIA & SER issued on 6/30/82 and 7/8/82, respectively. Staff filed motion for summary disposition on 9/3/82 in response to intervenor's motion concerning litigable issues dated 8/20/82. ASLB ruled on summary disposition 10/1/82 memorandum and order. One generic issue admitted. Hearing scheduled for 11/17/82-11/20/82.
Point Beach 1	T. Colburn	R. Bachmann	Steam Generator Replacement	8/10/82	Intervenor filed request for hearing dtd 8/10/82. ASLB established pre-hearing conference set for 11/20/82.
Rancho Seco	S. Miner	R. Black	Commission Order of May 7, 1981, related to TMI Related Modifications	5/15/79	Initial Decision of ASLB under review by ASLAB sua sponte.

OPERATING REACTORS HEARING SUMMARY

Facility	Project Manager	Hearing Attorney	Subject	Initiation Date	Status
Salem 1	W. Ross	B. Smith	Spent Fuel Pool Modifications	3/7/78	Initial Decision issued October 27, 1980 authorizing amendment; affirmed by ASLAB on July 17, 1981 (ALAB-650). Commission declined review on November 9, 1980). Appeal has been filed before 3rd. Circuit Court of Appeals.
Three Mile Island 1	R. Jacobs	J. Gray J. Cutchin J. Goldberg	TMI-1 Restart	8/79	All Partial Initial Decisions issued; before the Commission for determination of immediate effectiveness. ASLAB also reviewing all ASLB PIDs.
Robinson 2	G. Requa	S. Treby	Radon	11/30/73	Partial Initial Decision issued by ASLB; affirmed by ALAB on October 31, 1979 (ALAB-569). Pending before ASLAB on radon only.

Section 4

Multiplant Action Descriptions for Active Issues

Multiplant Action Number: A-01

Title: 10 CFR 50.55a(g) ISI

Lead Project Manager: P. Tam

Priority: 1

Technical Review Branch(es): MTEB

Statement of Problem:

Licensees for boiling or pressurized water-cooled nuclear power facilities are required by 10 CFR 50.55a(g) to have an inservice inspection program that meets the requirements of Section XI of the ASME Boiler and Pressure Vessel Code and Addenda (The Code). If the licensee determines that it is impractical to meet certain requirements of the Code, justification must be provided to the Commission, which can grant relief from specific Code requirements or impose alternate requirements.

Background:

Staff review is currently several years behind originally planned schedules. The staff has previously given interim implementation guidance to the licensees by letter. In general, this guidance authorized the licensees to implement their ISI plans as proposed pending completion of review by the staff. In some cases the period for which the proposed plans and interim implementation authorization would apply has expired and the licensees have made subsequent submittals before the staff completed review of the original plan.

Current Status:

The backlog of ISI relief requests is being reviewed by a contractor (SAI). After the current backlog is cleared, reviews of requests for relief from code requirements will be conducted on a plant specific basis with a schedule keyed to inspection program update requirements.

Actions Requred to Complete the MPA:

Thirty-one facilities remain to be reviewed in FY-83.

Status Updated: 9/30/82

Multi-Plant Action No. A-02

No. of Plants: 73

Title: Appendix A - ALARA

Priority: 1

Cognizant Assistant Director: G. C. Lainas

Cognizant Branch Chief: J. F. Stolz

Lead Engineer: P. C. Wagner

Lead Technical Review Branch Effluent Treatment Systems Branch

Other Review Branches: Radiological Assessment Branch

Problem:

Implementation of Technical Specifications called for in 50.36a and Appendix I to 10 CFR 50.

Background:

Appendix I was published in 1975 and Model TS were sent to all licensees on 7/78, 11/78 and 7/79. Submittals have been received from all licensees except Kewaunee.

Current Status:

Action completed on 4 plants (Farley 2, Sequoyah, McGuire and TMI-1). Site visits are being conducted to discuss RETs implementation. No TERs or SERs have been received, from either FRC or EG&G both of whom have been contacted for these reviews

Action(s) Required to Complete the Licensing Action:

1. Contractor and NRR visits to each site to discuss RETs implementation.
2. Contractor provide NRR with updated SERs and negotiated TS.
3. DL issue license amendment.

Status Updated: 9/30/82

Multiplant Action Number: A-04

Title: Containment Leak Testing - Appendix J

Leak Project Manager: W. Paulson

Priority: 1

Technical Review Branch: CSB

Contractor: Franklin Research Institute

Statement of Problem:

Some operating plants may not be in full compliance with Appendix J to 10 CFR Part 50.

Background:

Appendix J to 10 CFR Part 50 was published after many nuclear power plants had either received their operating license or their containments had reached an advanced state of design of construction. Accordingly, some plants may not be in full compliance with Appendix J. Licensee submittals, including exemption requests and proposed Technical Specifications need to be reviewed.

Current Status:

Franklin Research Center is under contract for performing the review of the 47 remaining plants in this program. All (46) TERs have been received from Franklin Research Institute. No TER is expected for Dresden 1 which is on hold. All 46 SERs have been forwarded to DL by CSB. Twenty-eight licensing actions have been completed.

Actions Required to Complete the MPA:

ORPMs are working on the remaining SERs in preparation for issuance.

Status Updated: 9/30/82

Multiplant Action Number A-10

Title Contingency Planning

Lead Project Manager E. McPeek

Priority High

Technical Review Branch(es)

(Primary) Power Reactor Safeguards Licensing Branch, NMSS

(Secondary) Standardization and Special Projects Branch, NRR

Statement of Problem:

Development of a plan to specify for licensee personnel specific objectives which they must achieve to detect and deter threats, thefts or radiological sabotage for all NRC licensed commercial power reactors.

Background:

NRC Rules, as stated in 10 CFR Parts 50 and 73, require each utility licensed by the NRC to operate a commercial power reactor to submit for NRC approval and to implement a safeguards contingency plan.

Current Status:

1. Acceptance criteria have been developed and are stated in the following:

   a. 10 CFR Part 73, Appendix C
   b. Regulatory Guide 5.44
   c. Review Guideline 24

2. The Power Reactor Safeguards Licensing Branch, NMSS has the lead responsibility for reviewing the plans from a safeguards viewpoint. The Standardization and Special Projects Branch has the lead responsibility for reviewing the plans from a plant safety viewpoint.

3. No contractors are utilized in this licensing review.

Action Required to Complete the MPA:

1. For operating power reactors all plans have been reviewed and four (2) remain to be approved. The NMSS staff has provided, through the appropriate NRR Project Manager, specific comments for consideration and action by the licensees. Once these issues are resolved, license amendments will be issued.

2. For applicants for operating licenses, the NMSS staff has taken review actions designed to complete the review and acceptance of each plan prior to the target date of the issuance of the SER.

Status Updated: 9/30/82

Multiplant Action Number: A-11

Title: Guard Training PLans

Lead Project Manager: E. McPeek

Priority: High

Technical Review Branch(es)

(Primary) Power Reactor Safeguards Licensing Branch, NMSS

(Secondary) Standardization and Special Projects Branch, NRR

Statement of Problem:

Development of a plan to specify an acceptable level of training to be provided to the licensee's security force for implementation at all NRC licensed commercial power reactors.

Background:

NRC Rules, as stated in 10 CFR Parts 50 and 73, require each entity licensed by the NRC to operate a commercial power reactor to submit for NRC approval and to implement a security force training and qualification plan.

Current Status:

1. Acceptance criteria have been developed and are stated in the following:

    a. 10 CFR Part 73, Appendix B
    b. NUREG-0674
    c. NUREG-0219
    d. NUREG-0576

2. The Power Reactor Safeguards Licensing Branch, NMSS has the lead responsibility for reviewing the plans from a safeguards viewpoint. The Standardization and Special Projects Branch, NRR has the lead responsibility for reviewing the plans from a plant safety viewpoint.

3. No contractors are utilized in this licensing review.

Actions Required to Complete the MPA:

1. For operating power reactors all plans have been reviewed and ten (4) remain to be approved. The NMSS staff, through the appropriate NRR Project Manager, has provided specific comments for consideration and action by the licensees. Once these issues are resolved license amendments will be issued.

2. For applicants for operating licenses, the NMSS staff has taken review actions designed to complete the review and acceptance of each plan prior to the target date of the issuance of the SER.

Status Updated: 9/30/82

Multiplant Action Number: A-14

Title: 10 CFR 50.55a(g) Inservice Testing

Lead Project Manager: P. Tam

Priority: 1

Technical Review Branch(es): MEB , R-I, R-II, R-III, R-IV, R-V, ORB #3

Statement of Problem:

Licensees for boiling or pressurized water-cooled nuclear power facilities are required by 10 CFR 50.55a(g) to have an inservice testing program that meets the requirements of Section XI of the ASME Boiler and Pressure Vessel Code and Addenda (The Code). If the licensee determines that it is impractical to meet certain requirements of the Code, justification must be provided to the Commission, which can grant relief from specific Code requirements or impose alternate requirements.

Background:

Staff review is currently several years behind originally planned schedules. The staff has previously given interim implementation guidance to the licensees by letter. In general, this guidance authorized the licensees to implement their IST plans as proposed pending completion of review by the staff. In some cases the period for which the proposed plans and interim implementation authorization would apply has expired and the licensees have made subsequent submittals before the staff completed review of the original plan.

Current Status:

The backlog of IST relief requests is being reviewed by the above named organizations. After the current backlog is cleared, reviews of requests for relief from Code requirements will be conducted on a plant specific basis with a schedule keyed to testing program update requirements. Thirty-six of the backlog facilities are being reviewed by the regions.

Actions Required to Complete the MPA:

Forty-six facilities remain to be reviewed in FY-82.

Status Updated : 9/30/82

Multi-Plant Action No. B-04

No. of Plants: 37

Title: Reactor Vessel Overpressure Protection

Priority: 2

Cognizant Assistant Director: T. M. Novak

Cognizant Branch Chief: J. F. Stolz

Lead Engineer: A. W. DeAgazio

Lead Technical Review Branch RSB*

Other Review Branches:

Problem:
Prevent overpressurizing the reactor vessel when at low temperature. Applicable to PWRs only.

Background:
A number of events have demonstrated that administrative controls alone are not adequate to prevent low-temperature overpressure events at PWRs. All PWRs were requested to provide an overpressure protection system that is to be used when the plant is in a low-temperature shutdown condition.

Current Status:
All plants implemented their system with preliminary NRC approval followed by post implementation review of (a) electrical aspects; (b) reactor system aspects; (c) Technical Specifications. Twelve plants remain for which licensing action is required. SERs are available for three of the plants with only PM processing required. The remaining nine plants are being reviewed by contract with EG&G for reactor system aspects through RSB. Previous contracts through ORAB have generated TERs for electrical aspects.

Actions Required to Complete the MPA:

Complete SERs for the nine plants. Review Tech Specs by PM and lead PM. Issue Tech Specs and SERs for remaining plants.

Status Updated: 6/16/82

---

*ORPMs responsible for integrating existing electrical, instrument and control TER with RSB's review.

Multiplant Action Number: B-05 (USI A-42)

Title: Stress Corrosion Cracking - Implementation of NUREG-0313, Rev. 1

Lead Project Manager: Dick Clark

Priority: High

Technical Review Branches: ORAB, MTEB

Statement of Problem:

Leaks and cracks in the heat-affected zones (HAZs) of welds in BWR austenitic stainless steel piping and components have been observed since the mid-1960's. All the cracks have been attributed to intergranular stress corrosion cracking (IGSCC). The revised purpose of this task is to insure that all BWRs have adequate programs--as defined in NUREG-0313, Rev. 1--to: (1) design systems constituting the reactor coolant system pressure boundry (RCSPB) to minimize the potential for IGSCC, (2) select materials for the RCSPB resistant to IGSCC, (3) control the water chemistry environment so as to reduce the potential for intergranular corrosion, (4) detect potential cracking through augmented inspections before it develops into a through-wall leak, and (5) detect possible RCSPB leakage before it becomes significant.

Background:

In 1975 NRC (AEC) formed a Pipe Cracking Study Group (PCSG) to investigate the cause of cracking in BWR piping. In July 1977 the staff issued an implementation document, NUREG-0313, based on recommendations of the PCSG. As a result of cracking in large diameter pipes and in nozzles which had not been observed prior to 1975, a new PCSG was activated in September 1978. In October 1979 Revision 1 to NUREG-0313 was issued for comment; this contained the latest recommendations of the Study Group. Based on industry comments, the document was modified and reissued. In view of the revised staff acceptance criteria, the previous reviews were terminated (TACs 08207 through 08230 plus 11263). New TACs have subsequently been issued (TACs 46651-46674) to cover the revised review effort.

Current Status:

In February 1981 NUREG-0313, Rev. 1 was issued to all holders of BWR operting licenses or construction permits and to all applicants for operating licenses. By July 1, 1981 the applicants/licensees were to provide their program for replacement of service sensitive lines and welds, their program for augmented inservice inspection, their program for improving the water chemistry environment and incorporation of adequate leak detection capability. These submittals are being reviewed by EG&G Idaho under a technical assistance contract.

Multiplant Action Number - B-05 (USI A-42) cont'd

Actions required to Complete the Licensing Action:

Review of individual applicant and licensee responses to determine if they meet the guidelines published in NUREG-0313, Rev. 1. These reviews were initiated in May 1982. Priority is being given to completing the reviews on those BWRs with furnace sensitized safe ends. A total of 24 reviews need to be completed for operating reactors, all of which are scheduled for completion in FY83.

Status Updated: 9/30/82

Multi-Plant Action No. B-17

No. of Plants: 60

Title: Tech Spec Surveillance for Hydraulic Snubbers

Priority: 1

Cognizant Assistant Director: T. M. Novak

Cognizant Branch Chief: R. A. Clark

Lead Engineer: Leon B. Engle, ORB #3

Lead Technical Review Branch ORAB

Other Review Branches:

Problem: Operability of snubbers for LWRs is required to provide assurance that the structural integrity of the reactor coolant system and all other related systems is maintained during and following a seismic or other event initiating dynamic loads. OPERABILITY is verified by an Inservice Inspection and Testing Surveillance program specified in plant Technical Specifications (TS) Recent operating experience has indicated the need for changes, clarifications and improvements in the Inservice Surveillance Requirements for hydraulic snubbers.

Background:

By letter dated November 20, 1981, the NRC requested that all power reactor licensee's (except SEP) incorporate the model NRC TS in plant specific Appendix A TS. A similar request was sent to SEP operating licensees on March 23, 1981. The NRC TS require that the visual inspection frequency be based upon maintaining a constant level of snubber protection to systems. In order to provide assurance of hydraulic snubber functional reliability, a representative sampling of plant installed snubbers must be functionally tested during plant shutdowns at 18 month intervals. The required sampling provides a confidence level of 95% that 90% to 100% of plant specific snubbers will be OPERABLE within acceptance limits.

Current Status:

1) Resolution of this action requires the issuance of an Operating License Amendment except in those cases where a given facility does not utilize hydraulic snubbers.
2) The FY82 Operating Plan requires the completion of 25 B-17 actions.
3) A total of 35 actions have been completed to date:

Actions Required to Complete the MPA:

1) 32 actions have been completed to date for FY82.
2) FY82 quota of 25 items completed plus 7 additional completed items.

Status Updated: 9/30/82

Multi-Plant Action No. B-22

No. of Plants: 66

Title: Tech Spec Surveillance for Mechanical Snubbers

Priority: 1

Cognizant Assistant Director: T. M. Novak

Cognizant Branch Chief: R. A. Clark

Lead Engineer: Leon B. Engle, ORB #3

Lead Technical Review Branch ORAB

Other Review Branches:

Problem:

OPERABILITY of snubbers for LWRs is required to provide assurance that the structural integrity of the reactor coolant system and all other related systems is maintained during and following a seismic or other event initiating dynamic loads. Operability is verified by an Inservice Inspection and Testing Surveillance program specified in plant Technical Specifications (TS). Prior to initiation of MB-22, mechanical snubbers had not been included in operating plant surveillance programs. Recent operating experience has indicated that mechanical snubbers require OPERABILITY requirements similar to those required for hydraulic snubbers.

Background:

By letter dated November 20, 1981, the NRC requested that all power reactor licensee's (except SEP) incorporate the model NRC TS for mechanical snubbers in plant specific Appendix A TS. A similar request was sent to SEP operating licensees on March 23, 1981. The NRC TS require that the visual inspection frequency be based upon maintaining a constant level of snubber protection to systems. In order to provide assurance of mechanical snubber functional reliability, a representative sampling of plant installed snubbers must be functionally tested during plant shutdowns at 18 month intervals. The required sampling provides a confidence level of 95% that 90% to 100% of plant specific snubbers will be OPERABLE within acceptance limits.

Current Status:

1) Resolution of this action requires the issuance of an Operating License Amendment except in those cases where a given facility does not utilize mechanical snubbers.
2) The FY82 Operating Plan requires the completion of 25 B-22 actions.
3) A total of 41 Actions have been completed to date.

Actions Required to Complete the MPA:

1) 25 actions have been completed to date for FY82.
2) FY82 quota of 25 items completed

Status Updated: 9/30/82

Multiplant Action Number: B-23

Title: Potential Equipment Failures Associated with Degraded Grid Voltage

Lead Project Manager: R Dudley

Priority:

Technical Review Branch(es): Power Systems Branch

Statement of the Problem:

Potential exists for supplying safety and non-safety equipment with voltage outside the range for which it was designed for longer than transient periods. Such conditions could result in safety-related equipment being unavailable to mitigate the consequences of an accident.

Background:

On July 20, 1976, Northeast Nuclear Energy Company (NNECo) reported that, following a trip of Millstone Unit No. 2 on July 5, 1976, several motors powered from 480 volt (v) motor control centers failed to start as required. The failure of the 480 v motors to start was traced to blown control power fuses on the individual motor controllers. These controllers received control power through 480 v/120 v transformers within the controller.

NNECo's investigation disclosed that, as a result of the plant trip, the grid voltage dropped from 352 kv to 333 kv. This voltage drop, in conjunction with additional voltage drops associated with the transformers involved, reduced the control power and voltage within individual 480 v controllers to a voltage which was insufficient to actuate the main line controller contractors. As a result, when the motors were signalled to start, the control power fuses were blown. Subsequent testing by NNECo showed that the contractors required at least 410 v to function properly.

NNECo concluded that under similar low voltage conditions, the operability of 480 v Engineered Safety Feature equipment could not be assured.

NNECo's immediate corrective action was to raise the setpoint of the Engineered Safeguards Actuation System (ESAS) "loss of power" under-voltage relays to assure that the plant would be separated from the grid and that emergency power system (dual) operation would be initiated before the control voltage fell below that required for contractor operation. A trip of the under-voltage relays causes the emergency buses to be de-energized and a load shed signal to strip the emergency buses, the diesel generators to start and power the emergency buses, and required safety related loads to sequence start on the buses.

Background (Cont'd)

On July 21, 1976, NNECo reported that the earlier corrective action taken was no longer considered appropriate because during starting of a circulating water pump, the voltage dropped below the new ESAS undervoltage relay setting. This de-energized the emergency buses, caused load shedding to occur, started the diesel generators and began sequencing loads onto the emergency buses in accordance with the design. However, during sequencing of the loads onto the buses, the voltage again dropped below the undervoltage relay setting which caused the load shed signal to strip the buses. The result was energized emergency buses with no loads supplied.

Current Status:

All utilities operating plants (BWR, PWR, HTGR) licensed prior to 1976 must provide under-voltage relays which separate the plant from the grid (in case of degraded grid voltage) and activate the plant emergency power system. The current DL schedule requires this item to be completed in FY-1982. Technical review is provided by the Power Systems Branch, with contractor technical support from Lawrence Livermore Lab and EG&G.

67 - operating plants covered by B-23
67 - SERs completed(14 of which have open items)
50 - Licensing Actions completed

Actions Required to Complete the MPA:

Complete the 14 remaining SERs. Complete the 17 remaining licensing actions.

Status Updated: 9/30/82

Multi-Plant Action No B-24*
*B-20 integrated into B-24 on 8/25/80

No. of Plants: 66

Title: Venting and Purging Containment While at Full Power and Effect of LOCA

Priority: High

Cognizant Assistant Director: T. Novak

Cognizant Branch Chief: S. Varga

Lead Project Manager E. Reeves, ORB#1, DL

Lead Technical Review Branch: CSB/DSI, M. Fields

Other Review Branches: EQB/DE, ORAB/DL & AEB/DSI

Problem:

Purging and/or venting of reactor containment buildings with reactor coolant temperature above 200°F may result in LOCA site boundary doses exceeding 10 CFR 50 Part 100 limits.

Background:

Events at Millstone 1 and Salem 1 (where the automatic high radiation closure of purge valves was overridden by operators) resulted in a generic letter being sent to all licensees of operating reactors in November 1978. A report was also made to Congress (#78-05). NRC advised of the events, requested licensees take action to minimize purge and vent operations, and requested response to SRP 6.2.4 and CSB BTP 6-4. In October 1979 an Interim Position was developed by the staff and licensees were requested to conform to it pending completion of our long-term review. In August 1980 generic item B-20 Leakage of Resilient Seals for purge and vent valves was integrated into the B-24 issue. A staff position to require Technical Specifications (as a leakage surveillance at either 3-months or 6-months intervals depending on valve usage) was developed and is included in the guidance being provided to licensees as specific plant reviews progress.

Current Status:

1. All licensees have responded to the November 1979 request for information. Reviews of licensee submittals are still underway although TMI-2 and the April 1980 reorganization of NRR caused delays. All licensee's responses to the October 1979 Interim Position have been reviewed and found acceptable as an interim measure. IE is monitoring licensees for continued compliance with these interim commitments.

2. The Lead Project Manager has issued guidance in memoranda dated August 25, 1980, March 24, 1981 and July 3, 1982 to all OL OR Branch Chiefs & PMs and to the Technical Review Team. The August 25, 1980 memorandum identified the new TACS, the reviewers and assignments to assure continuation of reviews during the NRR reorganization period after April 1980. Later status and guidance is described in item 4 below.

3. Contracts are/were managed by the Technical Review Team as follows:

   a. Electrical Reviews were managed by ORAB/DL with contracts to EG&G, Inc., Idaho and LLNL San Ramon, and FRC, Philadelphia. SEP reviews were managed by SEP with contract to EG&G Idaho.

   b. Valve operability reviews are managed by EQB/DE with contract to BNL.

   c. CSB 6-4 Review requirements were managed by CSB/DSI with contract to LLNL.

   d. Radiological Impact Reviews were managed by AEB/DSI with contract to EXXON Nuclear Idaho Company, Inc.

4. As of June 8, 1981, a sample letter prepared by ORB #1 (concurred in by CSB/DSI) was prepared for issuance to each licensee with the next NRC action letter (either Q's or SER). The sample letter (provided in Lead PM Memorandum dated June 19, 1981 to all Project Managers) contains the NRC position clarifications and sample Technical Specifications to close out the long-term reviews. The overall B-24 review will also complete TMI Item II.E.4.2, except for II.E.4.2.5 Containment Pressure Setpoint. On September 30, 1982 CSB/DSI provided SER's for II.E.4.2.6 and II.E.4.2.7. Project Managers were directed by Lead PM memorandum dated October 22, 1982 to complete all DL action on II.E.4.2 no later than the end of the first quarter FY83.

Actions Required to Complete B-24 and B-20 Licensing Actions:

1. Project Managers have issued the update status of the NRC reviews to each licensee except as noted below. This status letter was important to get the issue clearly understood by each PM and each licensee and to get the long term action completed. Lead PM records show that three plants (Davis-Besse, Millstone 2 and North Anna 1) have not been sent the status letter now scheduled for issuance by October 30, 1982. These letters contained the staff guidance and any existing staff SER's received to date.

2. CSB, EQB, AEB and ORAB should complete any remaining plant specific SER's and provide to Project Manager. Emphasis should be placed on completing the valve operability reviews on an expedited basis since these reviews are the most time consuming and have the most technical problems especially with valves larger than 20 inch diameter. Technical reviewers are providing a status report to the Lead PM on the SER's during each Quarterly Review Meeting.

3. Project Managers should review any licensee Technical Specification submittals and issue license amendments as required. Consult with Lead PM if problems occur.

4. TMI Item II.E.4.2.5 reviews by CSB have been completed except for Crystal River 3. Licensing action is complete except for Crystal River 3 and Palisades. Project Managers should complete this action.

Status Updated: 9/30/82

Multiplant Action Number: B-25

Title: Feedwater and CRD Nozzle Cracking

Lead Project Manager: P. W. O'Connor

Statement of Problem:

BWR feedwater nozzles and control rod drive nozzles have developed cracks due to thermal fatigue.

Background:

The generic issue has been resolved by the 11/13/80 issuance of NUREG-0619 which provided licensees of BWRs with acceptable methods to resolve the issue on a plant-by-plant basis.

Current Status:

Thirteen plants have committed to follow the staff's guidance and have received letters confirming that their proposed action is acceptable. The licensing action is complete on these plants. Each will submit a post-implementation report following completion of their proposed modification.

Ten plants are being reviewed to resolve deviations from NUREG-0619 guidance. Additional information and/or commitments are required from these plants to permit the staff to issue a confirmatory action letter or a show cause order to require compliance with staff requirements.

Actions Required to Complete the MPA:

Complete the review of the deviations on the eleven remaining plants. Obtain commitments to follow NUREG-0619 guidance or issue orders requiring compliance if necessary.

Status Updated: June 18, 1982

Multiplant Action Number: B-41

Title: Fire Protection - Final Tech Specs - Final SER Supplements

Priority: High

Lead Project Manager: T. Wambach

Review Branches: CEB, ASB, PSB, ICSB, RSB, PTRB, LQB

Statement of Problem:

Protection of safe, shutdown capability from the adverse effects of fire in any area of the plant. During the OL review of plants licensed prior to July 1976, no in-depth review was performed in this area.

Background:

Fire at Browns Ferry Nuclear Plant in March 1975 disabled redundant safety divisions and normal safe shutdown equipment. NUREG-0050.

Current Status:

10 CFR 50.48 and Appendix R to 10 CFR 50 became effective February 17, 1981. The licensees for 55 units licensed prior to January 1, 1979 and for 3 units licensed after January 1, 1979 are making submittals describing (1) plans and schedules to meet Appendix R, (2) design descriptions of alternative, safe shutdown modifications, and (3) exemption requests from Appendix R .

Action(s) Required to Complete the Licensing Action:

The submittals described above for all 59 units must be reviewed and acted upon . This will entail issuing exemptions, exemption denials and SERs approving alternative or dedicated safe shutdown modifications. Review of new OLs is now incorporated in the SRP. Final Tech Specs covering the equipment added as a result of Appendix R must also be issued after the modifications are complete.

Status Updated: 9/30/82

Multiplant Action Number: B-48

Title: Adequacy of Station Electric Distribution Voltage

Leak Project Manager: R. Dudley

Priority: 2

Technical Review Branch(es): PSB

Statement of Problem:

This review is intended to determine if the onsite distribution system in conjunction with the offsite power sources has sufficient capacity and capability to automatically start and operate all required safety loads within the equipment voltage rating.

Background:

At Arkansas Nuclear 1, loss of offsite power indicated that the electric distribution systems were inadequate for two unit operation. All utilities were asked to review their distribution systems to see if voltages were adequate.

Current Status:

69 - operating plants covered by B-48
56 - SER's completed (15 of which have open items)
36 - Licensing Actions completed

Actions Required to Complete the MPA:

Complete the remaining 28 SER's.
Complete the remaining 33 licensing actions.

Status Updated: 9/30/82

Multi-Plant Action No. B-57

No. of Plants: 44

Title: Decay Heat Removal Capability

Priority: 2

Cognizant Assistant Director: T. M. Novak

Cognizant Branch Chief: J. F. Stolz

Lead Engineer: A. DeAgazio

Lead Technical Review Branch None

Other Review Branches:

Problem:
To assure redundancy in decay heat removal capability by incorporation of requirements into the Technical Specification.

Background:

Various events at PWRs that have occurred during shutdown conditions have indicated that administrative controls to assure decay heat removal capability have been inadequate. All PWR licensees were requested (in a letter dated June 11, 1980) to incorporate requirements for redundancy into their TSs.

Current Status:

Acceptance criteria are: (1) redundancy in decay heat removal capability must be provided for all modes or temperature ranges of operation, particularly in Modes 4, 5 and 6, and (2) adequate surveillance requirements must be provided. A total of 16 plants remain to be reviewed. Indian Point 2 and 3 have not responded to our original request.

INEL is reviewing submittals and identifying where the proposed TSs, in conjunction with existing TSs, do not conform with our Standard TSs.

Actions Remaining:
1) Review applicable sections of the Kewaunee, Crystal River 3 and Palisades Technical Specifications
2) Review TER's as they are completed. Decide whether deficiencies are serious enough to warrant additional requests to licensees. If not, issue the license amendment as requested.

Status Updated: 6/16/82

Multiplant Action No. B-58a

No. of Plants: All BWRs

Title: BWR Scram Discharge Volume Technical Specifications

Lead Project Manager: K. Eccleston

Priority: High

Technical Review Branch: ORB#2

Statement of Problem:

Common cause failures of instrument volume level switches. Precursors at Hatch and Brunswick resulted in IE Bulletin 80-14.

Background:

Model Technical Specifications were sent to the industry by letter dated July 7, 1980. Submittals were subsequently received from the affected licensees and have been reviewed by the Franklin Research Center.

Current Status:

NRC contract NRC-03-81-130 has been issued to Franklin Research Center to review licensee submittals and write TERs. Final TERs for all 23 affected plants have been received as of 9/30/82; SERs have been provided for these plants.

Action Required to Complete the MPA:

Issue remaining license amendments upgrading TS.

Status updated: 9/30/82

Multiplant Action No. B-58b

No. of Plants: All BWRs (except LACBWR) - 23

Title: BWR Scram Discharge Volume Long Term Modifications

Lead Project Manager: K. Eccleston

Priority: High

Technical Review Branch: ASB

Statement of Problem:

Concerns raised as a result of the partial failure to scram event at Browns Ferry 3 on June 28, 1980 were documented in the staff's Safety Evaluation Report on the BWR Scram Discharge System dated December 1, 1980. A letter was issued on October 1, 1980 requesting a commitment to conform with revised criteria.

Background:

A letter dated December 9, 1980 forwarded the staff's generic SER with revised criteria. A letter dated March 30, 1981 provided clarification of the requirements for diverse instrumentation.

Current Status:

OMB clearance has been received and orders will be issued in near future.

Action Required to Complete the MPA:

Obtain acceptable responses and commitment dates. Issue orders with model Technical Specifications. Issue NRC contract to FRC to perform post-implementation verification or utilize regional inspectors, as appropriate.

Status updated: 9/30/82

Multi-Plant Action No. B-59

No. of Plants: 70

Title: Masonry Wall Design

Priority: 2

Cognizant Assistant Director: G. C. Lainas

Cognizant Branch Chief: R. A. Clark

Lead Engineer: Charles Trammell

Lead Technical Review Branch SEB, SEPB

Other Review Branches:

Problem:
Inadequate design criteria for masonry walls. Applies to all plants.

Background:
Problem was discovered at Trojan during reviews associated with IEB 79-02 (anchor bolts) and IEB 79-14 (As-built verification). A masonry wall was found which supported numerous safety-related pipes which was not adequate to resist seismic forces. This resulted in the issuance of IE Bulletin 80-11 on May 8, 1980. NRR (SEB) has been assigned the responsibility to review licensee's responses to this Bulletin.

Current Status:
Franklin Research Center has been contracted to review most licensee submittals (exception: Trojan, Cooper, Dresden 1, Humboldt Bay, LaCrosse, Yankee-Rowe). Trojan is being reviewed by SEB. LaCrosse and Yankee-Rowe will be reviewed by SEPB. Dresden 1 and Humboldt Bay are currently in a shutdown status, and will be reviewed by SEB if/when needed. Cooper has no safety-related masonry walls covered by IEB 80-11. Close-out letter for Cooper has been issued (2/17/82). Review schedule and acceptance criteria for review have been established.

Actions Required to Complete the MPA:
62 plants remain to be completed. Eight finished to date. FRC review is active.

Status Updated: 9/30/82

Multiplant Action Number: B-60

Title: Environmental Qualification of Electric Equipment for
Nuclear Power Plants

Lead Project Manager: Jose A. Calvo

Priority: 1

Technical Review Branch: Equipment Qualification Branch

Statement of Problem: All plants are required to meet the Commission Memorandum and Order CLI 80-21 concerning 10 CFR 50, Appendix A, GDC 4.

Background: The issue originated from a 1977 petition from the Union of Concerned Scientists on fire protection and equipment qualification. The multiplant action arose from the Commission Memorandum and Order CLI 80-21. Technical resolution of acceptance criteria were produced from Unresolved Safety Issue A-24.

Current Status: Thirty-three (33) Technical Evaluation Reports have been issued by Franklin Research Center. It is anticipated that the remaining thirty-eight Technical Evaluation Reports will be completed by April 1983.

The environmental qualification rule is now in the final stages of approval. The final rule contains a new implementation schedule which would supersede the June 30, 1982 deadline for completion of environmental qualification of electrical equipment when the rule is adopted as final. The Commission had expected to publish the final rule by June 30, 1982, however this has not proved possible. Therefore, the Commission found it necessary to suspend the June 30, 1982 deadline pending publication of the final rule.

Previous staff's evaluations of the licensee's justifications for interim operation, for 33 operating plants, are being examined to determine if the previous conclusions are still valid in light of (1) additional knowledge gained through the FRC reviews to date, and (2) the extension of the interim period of operation, due to the Commission action to suspend the EQ deadline.

Actions Required to Complete the MPA: Final SERs must be issued for all plants. The schedule for completion of each SER needs to be established, in particular for those plants for which a Technical Evaluation Report is available.

Status Updated: 9/30/82

Multi-Plant Action No. B-62

No. of Plants: 70

Title: ESF Reset Control Design Difficiency IE Bulletin 80-06

Priority: 1

Cognizant Assistant Director: G. Lainas

Cognizant Branch Chief: J. F. Stolz

Lead Engineer: Sydney Miner

Lead Technical Review Branch ICSB

Other Review Branches:

Problem:

Certain equipment would return to its normal mode following the reset of an ESF signal. This protective action of the affected systems could be compromised once the associated actuation signal is reset.

Background:

On March 13, 1980, the Office of Inspection and Enforcement issued Bulletin 80-06, "Engineered Safety Feature (ESF) Reset Controls," to address the concern that the use of reset pushbuttons alone could permit certain engineered safety feature systems components to revert to the normal state following safety system actuation. The bulletin specified actions to be taken by licensee to address these concerns. By Task Interface Agreement, ROI 80-15, the Office of Nuclear Reactor Regulation was assigned responsibility for evaluating the licensee's responses to the Bulletin.

Current Status:

1. Acceptance Criteria

   Unless an alternative is justified by the licensee and the justification is acceptable, upon reset of ESF signals all affected equipment shall remain in its emergency mode. If there is multiple sequencing, none of the reset actions shall cause the affected equipment to deviate from its emergency mode.

2. Important Schedule Considerations

   33 SER's were completed last FY. 5 SERs remain to be completed this year. 33 licensing actions were completed last fiscal year. Six licensing actions remain to be completed this year.

3. Identification and Role of the Contractors

   The detailed technical review of the licensees responses to I&E Bulletin 80-06 was performed by EG&G's Sam Ramon under DL's technical assistance contract with Lawrence Livermore National Laboratory. EG&G has completed their effort on this MPA.

Required to Complete MPA:

1.	EG&G complete review and issue TER	0 actions
2.	Review TER and issue SER	5 actions
3.	Issue SER to licensees	6 actions

Status Updated: 9/30/82

Multiplant Action Number B-63

Title Emergency Procedures and Training for Station Blackout

Lead Project Manager Chris Nelson

Priority High

Technical Review Branch(es) ORB #3

Statement of Problem:

All plants are required to implement emergency procedures and training for station blackout events (loss of all onsite and offsite ac power)

Background:

ASLAB (ALAB-603) concluded that station blackout should be considered a design basis event for St. Lucie 2.

NRC staff currently assessing station blackout on a generic basis (USI A-44)

Station Blackout procedures and training determined advisable action prior to completing A-44.

Current Status:

Generic letter 81-04 sent 2-25-81 requesting all plants (except St. Lucie 1&2) implement emergency procedures and training.

All but three plants have indicated procedures and training will be implemented on an acceptable schedule.

Actions Required to Complete the MPA:

Letters must be sent to 2 plants requesting information

Response from one plant must be evaluated

Status Updated:

June 21, 1982

Multiplant Action No. B-65

No. of Plants: All BWRs (execpt LACBWR)- 23

Title: Safety Concerns Associated with Pipe Breaks in BWR Scram System

Lead Project Manager: K. Eccleston

Priority: High

Lead Technical Review Branch: ORAB

Other Review Branches: ASB, PTR, EQB, RAB, AEB, RRAB, CSB, RSB, ORB#2, ICSB, OLB, SPE

Statement of Problem:

Assess the overall risk to long-term core cooling from postulated pipe break in Scram Discharge Volume; investigate the mitigation capability for the postulated event; establish generic recommendations for correcting any deficiencies identified.

Background:

Draft NUREG-0785 issued April 3, 1981 by AEOD described certain safety concerns associated with postulated pipe breaks in the BWR Scram System. NRC letter dated April 10, 1981 to all BWR licensees requested a generic evaluation of the concerns within 45 days and a plant specific review within 120 days. The generic evaluation was submitted by GE on behalf of the BWR owners by letter dated April 30, 1981.

Current Status:

NUREG-0803 was issued to BWR licensees and applicants on 8/31/81. Plant specific licensee responses to concerns identified in this NUREG are being evaluated.

Action Required to Complete the MPA:

Review licensee's plant specific responses to the guidance contained in NUREG-0803.

Status updated: 9/30/82

Multiplant Action Number B-66

Title Natural Circulation Cooldown

Lead Project Manager Ken Heitner

Priority Medium

Technical Review Branch(es) RSB (N. Lauben, M. E. Keane)

Statement of Problem:

All PWRs must review plant cooldown on natural circulation to determine if voiding will occur in the reactor vessel.

Background:

St. Lucie Unit 1, while cooling down on natural circulation due to a component cooling water malfunction, developed a steam space in the upper head of the reactor vessel.

Core cooling was not lost however complex situation deemed on undesirable challenge to the operator.

Current Status:

Generic letter 81-21, issued May 5, 1981, requested:

1. demonstration that natural circulation cooldown by procedure should not result in reactor vessel voiding
2. verification that supples of condensate grade aux feedwater are sufficient
3. aspects of training and procedures dealing with this subject

All licensees have responded

Westinghouse Owners Group Generic Report (OG-57) dated 4-20-81

Plant specific leadcase for St. Lucie is in review.

Actions Required to Complete the MPA:

Review all responses as well as Generic Westinghouse Report

44 actions remain-all scheduled for FY83

Status Updated:

9/30/82

FORMAT FOR MPA STATUS SHEETS

Multiplant Action Number B-67

Title Pressurized Thermal Shock to Reactor Pressure Vessels

Lead Project Manager Guy S. Vissing

Priority 1

Technical Review Branch(es) ORAB, MTEB, RSB, CPB, PTRB, GIB, RRAB

Statement of Problem:

Concerns a possibility that in PWRs pressure vessels could be subjected to severe overcooling transients followed by repressurization which could threaten the integrity of the RPVs.

Background: Pressure vessel thermal shock has been considered for many years in the context of assuring integrity in the vessel when subjected to cold emergency core cooling water during a large LOCA. Based on fracture mechanics analyses verified by enforcements, it was concluded that a postulated flow would not propagate through the vessel wall during a large LOCA. As a result of operating experience it was subsequently recognized that there could be transients in PWRs in which the vessel could be subjected to severe overcooling (thermal shock) followed by repressurization. In these pressurized thermal shock (PTS) transients, vessels could be subjected to pressure stresses superimposed upon the thermal stresses resulting from the temperature differences across the vessel wall. By letter dated April 20, 1981, we requested the PWR Owners Groups to address this problem and the licensees of operating PWRs to provide a response.

On the basis of our review of the PWR Owners Groups' responses and the PWR licensees' responses to our letter of April 20, 1981, and on the basis of our independent analysis, we determined that all operating plants could survive a severe overcooling event for at least another year of full power operation. However, for plants where neutron irradiation has significantly reduced the fracture toughness of the reactor pressure vessels (RPV), we decided that action should be taken to resolve the long term problems. Accordingly, under 10 CFR 50.54(f), by letter dated August 21, 1981 we requested from licensees of eight plants (based on the reference temperatures of the RPV and system characteristics), information concerning the issue of PTS to RPV. Specifically we requested within 60 days information related to: (1) the Reference Temperature for Nil Ductility Transition (RT_{NDT}) for the RPV and (2) operator action to prevent pressurized thermal shock and ensure vessel integrity. Also, we requested within 150 days information which would define actions and schedules for resolution of the PTS issue and analyses to support continued operation.

The eight plants selected were: Fort Calhoun, Robinson 2, San Onofre 1, Maine Yankee, Oconee 1, Turkey Point 4, Calvert Cliffs 1 and Three Mile Island 1.

By Commission Paper SECY 81-687 dated December 8, 1981, PTS was designated as an Unresolved Safety Issue. However, at the Commission briefing of November 24, 1981, we committed to having a staff position by Summer 1982 and by memorandum dated November 24, 1981 (Harold Denton to D. Eisenhut and S. Hanauer) Harold Denton directed that for those plants of immediate concern DL should manage the development of a short term resolution which can meet the scheduled committed to the Commission (Summer 1982).

Current Status:
The "60 day" and 150 day responses have been received for all plants except TMI-1. GPU will be submitting their 150 day response by the end of June 1982. The responses are under review in addition to supplemental information provided as a result of the Staff's meeting with industry representatives of June 9, 1982. A staff position is being formulated and a staff report to the Commission is being prepared.

Action Required to Complete MPA:
Our input is being prepared with appendices which will address evaluation and recommendation for each plant. The distribution of the report and the type of action which will follow will evolve after the staff's presentation to the Commission.

Multi-Plant Action No. B-69

Title: PWR Main Steam Line Break with Continued Feedwater Addition

Priority: High (IE Bulletin 80-04)

Lead Project Manager: Ed Tourigny

Lead Technical Review Branch: CSB/DSI

Other Review Branches: RSB, ICSB/DSI

Problem:

A licensee submitted a report to NRC identifying a deficiency in the original main steam line break (MSLB) analysis for their plant. They determined that, if the auxiliary feedwater system continued to supply feedwater at runout conditions to the affected steam generator, containment design pressure would be exceeded in about 10 minutes. The long term effect of the water supplied by the auxiliary feedwater system also had not been considered in prior analyses.

Background:

Virginia Electric and Power Company (VEPCO) submitted a report to the Nuclear Regulatory Commission (NRC) dated September 7, 1979 identifying a deficiency in the original main steam line break (MSLB) analysis for North Anna Power Station, Units 3 and 4. Stone and Webster Engineering Corporation re-analyzed the containment pressure response following a MSLB and determined that, if the auxiliary feedwater system continued to supply feedwater at runout conditions to the affected steam generator, containment design pressure would be exceeded in about 10 minutes. The long term effect of the water supplied by the auxiliary feedwater system had not been considered in prior analyses.

On October 1, 1971, IE Information Notice No. 79-24 was sent to all holders of operating licenses and construction permits, informing them of VEPCO's finding. The Consumer Power Company of Michigan (Palisades, Unit 1 facility) conducted an accident analysis review pursuant to the Information Notice and found that with offsite power available, the condensate pumps would feed the affected steam generator at an excessive rate. This was not considered in their analysis of the MSLB accident.

Because of the deficiencies that were identified in the original MSLB analyses, IE Bulletin No. 80-04 was issued on February 8, 1980. The IE Bulletin requested licensees and certain applicants of PWR facilities to assess the effect of continued feedwater or condensate addition on the containment response and reactor core reactivity response to a MSLB accident. The IE Bulletin was sent to all licensed PWR facilities and to those PWR facilities nearing licensing (Diablo Canyon, McGuire, North Anna 2, Salem 2, and Sequoyah).

Current Status:

As of May 1, 1981, 46 PWR licensees have responded to IE Bulletin 80-04. On August 17, 1981, Franklin Research Center was authorized to begin work reviewing the responses to IE Bulletin 80-04. As of April 16, 1982, Franklin Research Center concluded that some licensee submittals did not provide adequate information for them to complete their review; licensees are being requested to provide the additional information. As of 10/22/82, twenty-nine reviews and their associated licensing actions were completed. This assignment is expected to be completed by the contractor by December 31, 1982.

Action(s) Required to Complete the Licensing Action:

1) Review licensees' responses to IE Bulletin 80-04.
2) Evaluate licensees' responses.
3) Evaluate licensees' corrective actions.
4) Issue Safety Evaluation Report on licensees' responses and corrective actions.

Updated: 9/30/82

Multi-Plant Action No. C-01
Title: PWR Secondary Water Chemistry
Lead Project Manager: M. Grotenhuis
Priority: 2
Technical Review Branch(es): ChEB

Statement of Problem:

PWR facilities only are affected. The NRC staff's testimony at the January 1976 Prairie Island public hearings on steam generator tube integrity set forth the regulatory position regarding secondary water chemistry monitoring requirements. The NRC position is that monitoring requirements are needed to assure control of harmful impurity buildup in the steam generator that could cause tube corrosion and impair tube integrity.

Background:

Letters were sent to PWRs requesting Technical Specifications changes to incorporate Secondary Water Chemistry monitoring requirements; a number of licensees objected to this approach on the basis of potential limitations to plant operating flexibility. NRC changed its position and requested a license condition that requires the implementation of a secondary water chemistry monitoring and control program containing appropritae procedures and administrative controls.

Current Status:

Five plants remain to be closed out. Many facilities were resolved by ORPM's owing to a lack of Technical Review priority in the post TMI period. Recent scheduling of tasks inside the NRC has made Technical Review capacity again available enabling planning for a relatively early completion.

A contractor is now involved; this is Brookhaven National Laboratories. All actions are scheduled for completion this fiscal year.

Action(s) Required to Complete the MPA:

These requests have been sent to the five licensees and we are awaiting the responses.

Status Updated: 9/30/82

Multiplant Action Number C-04

Title ESF Filter Tech. Specs.

Lead Project Manager J. Lombardo

PRIORITY 3

Technical Review Branch (es) ETSB

Statement of Problem:

Some licensee have not submitted T. S. Regarding ESF filters which comply with the position of RG 1.52

Background:

Letters sent out in 1976-1977 to all licensees. Most have been completed.

Current Status:

3 *plants are outstanding. All T. S. to be issued by 12/82.

Actions Required to Complete the MPA:

Awaiting Submittal. Project Managers are pursuing

*Surry 1/2, Palisades

Status Updated 9/30/82

Multiplant Action Number: C-06 - INACTIVE

Title: Pump Support - Lamellar Tearing

Leak Project Manager: R. Emch

Priority: 2

Technical Review Branch: GIB

Statement of Problem:

The potential for low fracture toughness and lamellar tearing on steam generators (including vessel, pressurizer and torus supports) exists due to variability in fracture toughness and resistance to corrosion of support materials.

Background:

Was unresolved safety issue A-12. Additional complication is that supports other than integrally welded are not covered in ASME Code and GDC and may require rule-making. Resolution of issue will occur with issuance of the "Final" NUREG-0577 in early 1982.

Current Status:

1. Acceptance criteria will be provided in NUREG-0577

2. No schedule has been set.

3. GIB/DST (Dick Johnson) has responsibility; however, 6 plants (Indian Point 2/3, San Onofre 1, Turkey Point 3/4, and Arkansas 2) will be reviewed under FRC contract (Bill Koo). These plants did not provide adequate information originally. Preliminary reviews have been completed on these 6 plants, but the detailed review is waiting for guidance of NUREG-0577.

4. In early 1982, C-06 was removed from the list of active multiplant actions. At that time, DL concluded that this issue was not ready for implementation at operating reactors since NUREG-0577 was not published in final form.

Actions Required to Complete the MPA:

Completion of NUREG-0577 is first step. Further steps to be determined based on guidance in NUREG. This MPA is in an inactive status.

Status Updated: 9/30/82

Multiplant Action Number: C-07

Title: Fuel Handling Accident Inside Containment

Lead Project Manager: J. Lombardo

Priority: 2

Technical Review Branch(es):

Statement of Problem:

By letter dated January 3, 1977 to Commissioner Gilinsky, Mr. Robert Pollard recommended that NRR review the potential consequences of a postulated fuel handling accident at each operating plant because this accident had not been considered during licensing of the plants.

Background:

Letters were sent to licensees of 39 operating plants in January 1977 requesting that they provide a detailed evaluation of the potential consequences of this accident. Letters were not sent to licensees of 24 operating plants because this accident had been evaluated in their SER.

Current Status:

There are 4* plants which are not complete. The issues range from concerns regarding X/Q to acceptability of filers.

Action Required to Complete the MPA:

The project managers are pursuing resolution of the remaining issues.

*Surry 1/2, Maine Yankee, Indian Point 2

Status Updated: 9/30/82

Multi-Plant Action No. C-10

No. of Plants: 54

Title: Control of Heavy Loads at Nuclear Power Plants

Priority: Phase I, High; Phase II, Medium

Cognizant Assistant Director: Tom Novak

Cognizant Branch Chief: Robert A. Clark

Lead Engineer: Glode Requa

Lead Technical Review Branch: Auxiliary Systems Branch

Other Review Branches: None

Problem: Dropped Heavy Loads may impact spent fuel, fuel in the core, or equipment that may be required to achieve safe shutdown and continued decay heat removal for PWRs and BWRs. If sufficient spent fuel or fuel in the core were damaged and if the fuel is highly radioactive, the potential releases of radioactive material could result in off-site doses that exceed 10 CFR Part 100 limits.

Background: USI - Task A-36 was established to examine staff licensing criteria, the adequacy of measures in effect at operating plants, and to recommend necessary changes to assure the safe handling of Heavy Loads. NUREG-0612 provides the results of the review and includes the task groups recommendation.

Current Status:

1. NUREG-0612 was issued to all licensees by letter dated December 22, 1980. The letter requested: interim actions to be completed in 90 days, a Phase I Action (report, confirmation and justification) in six months and Phase II (specific requirements) in nine months.

2. The criteria contained in NUREG-0612 is used for the acceptance criteria. The contractor is Franklin Research Center (FRC). FRC provides the TER's to the lead technical group ASB. Schedules were established to provide 59 TER's to DL for FY82 from the contractor for Phase I only.

3. Initial responses from the licensees have been very slow partially because detailed information required necessitated archival searches by previous lifting equipment suppliers and outdated equipment standards had to be compared with current standards for possible equipment upgrading as well as the complexity of information required was more than expected.

4. Draft TER's (requests for additional information) have been sent to all licensees except Kewaunee. Kewaunee has not yet satisfactorily responded to Phase I. Kewaunee's response is targeted for 11/15/82.

5. The licensees' have been slow in providing their initial responses and additional information on open items which has delayed the originally scheduled 59 TER's to DL in FY82.

6. The lead Project Manager has issued guidance and requested certain actions to be taken in memoranda dated January 15, 1982, April 26, 1982, and October 22, 1982, to all ORB Chiefs.

Actions Required to Complete C-10 Licensing Actions:

1. Project Managers expedite licensees for information necessary to close out open items as discussed in the April 26 and October 22, 1982 memoranda to all ORB Chiefs.

2. Contractor/ASB review open item submittals, prepare and issue final TER to DL:

   18 TERs FY83 53 TERs FY84

Status Updated: 9/30/82

Multiplant Action Number C-11

Title: Reactor Protection System (RPS) Power Supplies

Lead Project Manager: J. Van Vliet

Priority:

Technical Review Branch: PSB

Statement of Problem:

Design deficiencies have been identified in the BWR RPS MG set regulatory systems that could adversely affect the operability of the RPS if (1) a sequence of undetected single component failures were to occur or (2) a seismic event occurred that resulted in the postulated component malfunctions.

Background:

The design deficiency was first identified during the Hatch 2 licensing process. By letter dated August 7, 1978 the other BWRs were directed to review their designs and submit a report. That letter also directed that a surveillance program be implemented. By letter dated September 24, 1980 the licensees were requested to: (1) commit to installing a Class IE system, (2) provide a schedule for completion of the modification, and (3) provide a schedule for submitting design information and proposed Technical Specifications. All licensees responded satisfactorily.

Current Status

LLNL is writing TERs based on licensee submittals. PSB is writing SERs. Five reviews have been completed. Four installations are complete. All licensees except Browns Ferry are proposing modification installation prior to the end of 1983. Browns Ferry proposes an integrated schedule with modification installation in late 1984. No unresolved technical issues exist for this tiem.

Actions Required to Complete the MPA:

1. Review licensee's designs (post-implementation)
2. Review licensee's proposed TS changes
3. Issue license amendment that revises TS

Status Updated: 9/30/82

Multi-plant Action Number: C-14

Title: SEISMIC QUALIFICATION OF AUXILIARY FEEDWATER SYSTEMS

Lead Project Manager: J.T. Beard

Priority: 1

Technical Review Branch(es): ORAB
ASB

Statement of Problem

Since TMI-2, great attention has been focused on the ability of PWR's to reliably provide for shutdown decay heat removal at normal system pressure. The steam generator is the preferred and proven choice for accomplishing a safe shutdown of the plant. Therefore, the auxiliary feedwater systems (AFW) should satisfy the seismic design criteria for the Safe Shutdown Earthquake (SSE), consistent with other safety-related systems in the plant. However, only those facilities licensed recently have been reviewed against the NRC Standard Review Plan which treats the AFW as an Engineered Safety Feature.

Background

In August 1980, the NRC completed a preliminary study of the risk of a seismically induced loss of decay heat removal for plants without a seismically qualified AFW. One of the conclusions was that the increase in risk during the next three years is sufficiently small to allow plant operations to continue. Another conclusion was that plants should be surveyed to confirm the extent of the PWR plants without seismically qualified AFW.

In February 1981, the NRC developed and embarked on Multi-plant Action Plan C-14, "Seismic Qualification of Auxiliary Feedwater Systems." An objective to this plan is to increase, to the extent practicable, the capability of those plants without seismically qualified AFW to withstand earthquakes up to H. Denton dated February 20, 1981. Generic Letter 81-14 requested licensees: (1) to identify, via a walkdown of the AFW system, deficiencies ammenable to simple remedial actions, and (2) to review the plants to determine the extent and areas where significant improvements may be needed. The NRC will then take action to require licensees to make improvements such as re-analysis and/or modifications, for those plants which cannot demonstrate reasonable assurance of the functioning of the AFW system following an earthquake of SSE magnitude.

Current Status

In a Generic Letter (GL 81-14), dated February 10, 1981, the NRC requested under 10 CFR 50.54(f) that all operating PWR licensees complete AFW walkdowns and report information regarding the seismic capability of AFW. This action implemented the first phase of the C-14 program.

Lawrence Livermore National Laboratory under technical assistance contract FIN A-0429 is reviewing and evaluating the licensees' responses to GL 81-14. Of the 47 PWRs involved with this MPA, LLNL has found it necessary so far to generate Requests for Additional Information for over 40 plants, in order to correct deficiencies in licensees' responses or to obtain technical clarification of the licensees' responses.

In FY81, 2 TACS were completed. In FY82, 20 TACS were completed.

Actions Required to Complete the MPA

Twenty-five plant TACS remain active. LLNL is reviewing licensees' responses to Requests for Additional Information. The objective is to verify that AFW system walk downs were conducted and deficiencies identified, to report the level of seismic qualification of each area of the AFW, and to identify plants for which significant re-analysis and/or modifications may be needed. The results of this evaluation are to be reported both on a per plant basis and in a summary form for all the plants involved.

It is anticipated that LLNL can complete the plant-specific evaluations by 10/30/82 and the project summary report during the second quarter of FY83.

Status Update

9/30/82

Multi-Plant Action No.: D-01

No. of Plants: 22

Title: Mark I Containment Program

Priority: 1

Cognizant Branch Chief: D. Vassallo

Lead Engineer: B. Siegel

Lead Technical Review Branch: CSB-Load Audit Review
DRAB-Structural Audit Review

Other Review Branches: RSB, MTEB, RRAB, ICSB

Problem:

Since the original design of the Mark I containment system additional loading conditions resulting from the dynamic effects of drywell air and steam being rapidly furled into the suppression pool during a postulated LOCA and from suppression pool response to SRV operation generally associated plant transient operating conditions have been identified, the objective of this program is to restore the originally intended design safety margins for each Mark I containment system.

Background:

A Mark I Owners Group (OG) with GE the lead technical organization was formed to quantify the dyrodynamic loads and assess the effects of these loads on the Mark I containment structure. The OG divided this task into a short term (STP) and long term program (LTP).

The objectives of the STP were to verify that each Mark I containment system would maintain its integrity and functional capapability when subjected to the most probable loads induced by a postulated design-basis LOCA, and to verify that licensed Mark I BWR facilities would continue to operate safety, without endangering the health and safety of the public, while a methodical, comprehensive LTP was being conducted. The staff in the "Mark I Containment Short-Term Program Safety Evaluation Report," NUREG-0408 concluded that sufficient margin of safety had been demonstrated to assure the functional performance of the containment system and, therefore, any undue risk to the health and safety of the public was precluded.

The objectives of the LTP were to establish design-basis loads that are appropriate for the anticipated life of each Mark I BWR facility (40 years), and to restore the originally intended design-safety margins for each Mark I containment system. The principle thrust of this program has been the development of generic methods for the definition of suppression pool hydrodynamic loading events and the associated structural assessment techniques for the Mark I configuration. The generic anslysis techniques are intended to be

used to perform a plant-unique analysis (PUA) for each Mark I facility. The staff in the "Mark I Containment Long-Term Program Safety Evaluation Report," NUREG-0661 concluded that the load definition procedures utilized by the BWR Owner Group, as modidied by the staff's requirements provide conservative estimates of these loading conditions and that the structural acceptance criteria are consistent with the requirements of the applicable codes and standards.

Current Status:

The licensees are in the process of performing PUA and designing and installing modifications to meet the Commission's Order date for each operating plant. Based on the staff's review of the Mark I Owners Group June 29, 1981 submittal the staff prepared a Commission Paper (SECY-81-678) requesting Commission approval for extension of the exemptions and completion dates for plant modifications needed to comply with the staff's acceptance criteria contained in Appendix A to NUREG-0661. Commission approval was received on January 8, 1982 Orders extending the exemptions and completion dates were sent out to 21 of the 22 operating reactors (Cooper Nuclear Station will meet the existing Order date and therefore did not require an extension). The licensees are in the process of preparing plant-unique analysis for staff review. Plant unique analyses reports have been received from three of the fifteen licensees. Technical assistance contracts have been awarded to Franklin Research Center and Brookhaven National Laboratory to perform an audit review of the licensee's PUA. Lead technical review responsibility for the BNL load audit review has been transfered to CSB.

Actions Required to Complete the Licensing Action:

1) Submittal of the PUA to the NRC
2) Post implementation audit of PUA by Franklin Institute and BNL on Technical Assistance Contracts
3) Issuance of SER to each licensee on acceptability of Mark I LTP modifications and analyses for their plant.
4) Technical Specification changes resulting from Mark I Modifications

Status Updated: 9/30/82

Multiplant Action Number D-04

Title PWR Reactor Vessel Cavity Seal Ring Missile Potential.

Lead Project Manager Charles Trammell

Priority 2

Technical Review Branch(es) ORB #3

Statement of Problem:

The reactor vessel cavity seal ring can become a missile if left in place during operation should a LOCA occur in or near the reactor vessel cavity.

Background:

Trojan disclosed this as a possible problem via an LER. On 2/2/78, letters were sent to all PWR licensees requesting a solution by either (a) removing the seal ring during operation or (b) confirming by analysis that the seal ring can withstand blowdown forces.

Current Status:

38 plants-completed.

4 plants-remain to be completed:

Haddam Neck

San Onofre 1

Surry 1

Surry 2

The remaining 4 plants have submitted "leak-before-break" analyses in response to MPA D-10, "Asymmetric LOCA Loads." It is expected that NRC will accept this analysis. If so, this will also solve D-4 for these plants, since the seal ring will not become a missile under "leak" conditions.

Actions Required to Complete the MPA:

The resolution of the 4 remaining plants (identified above) is dependent on the resolution of D-10 as described above.

Status Updated:

9/30/82

Multi-Plant Action No. D-05
Title: Plant UPI Model Problem
Lead Project Manager: M. Grotenhuis
Priority: 3
Technical Review Branch: RSB

Statement of Problem:

Only 2 loop PWR's are affected. All Westinghouse (W) 2 loop plants have a Low Pressure Safety Injection System (LPSI) which injects water directly into the Upper Plenum of the Reactor Vessel (UPI). This is used to counter the consequences of a single failure for 2 loop units.

However, the currently approved ECCS evaluation models for two loop plants are based on an ECCS system in which LPSI is directly to the cold leg of the Reactor Coolant System and because of this may be considered as not meeting the requirements of 10 CFR Appendix K Section II.5.

Background:

This has been an outstanding issue for two loop plants since the implementation of Regulations for an approved ECCS system. The issue became a MPA during late 1977 and 1978 when an "interim" model was developed to review the potential effect of UPI against the conventional model.

Current Status:

Six facilities are affected. W 2 loop UPI plants are presently operating on the bases of a number of approaches being taken to determine allowable peaking coefficients in an interim manner.

Acceptable long term resolution involves development of satisfactory generic models with plant specific application. Both W and Exxon fuels are involved.

A contractor has been assigned to the review of proposed models to develop acceptable generic resolutions.

Plant specific reviews are proposed for fiscal year 1983.

Action(s) Required to Complete the MPA:

Generic models must be reviewed and approved for Westinghouse and Exxon.

Plant specific models must be approved for the six facilities.

Status Updated: 9/30/82

Multiplant Action Number: D-10

Title: Asymmetric LOCA Loads on Primary Reactor Coolant System

Lead Project Manager: J. Shea

Priority: Medium

Technical Review Branch(es): MEB, MTEB, CPB, CSB

Statement of Problem:

Asymmetric loads resulting from rupture of the primary piping could potentially damage reactor vessel support internals and other primary system components. Damage to the reactor internals could impair core coolability.

Background:

In January 1978, all pressurized water reactor (PWR) licensees were required by the NRC to provide an assessment of the adequacy of their reactor vessel supports and other affected structures to withstand combinations of responses to asymmetric loss-of-coolant accident (LOCA) loads and the Safe Shutdown Earthquake (SSE). This potential safety problem was subsequently identified as an unresolved safety issue Task Action Plan A-2.

Current Status:

All PWR plant assessments for asymmetric loads have been received and are currently being evaluated by staff and contractor EG&G. As a basis for this evaluation, staff is implementing criteria developed as part of the Task Action Plan A-2. These criteria are included in NUREG-0609. Concurrently, some PWR licensees have performed a study of "leak before break". Staff approval of the "leak before break" concept is expected in December 1982.

Action Required to Complete the Licensing Action:

Complete evaluation of Owners Group submittals including Westinghouse Owners Group proposed "leak before break" concept and plant specific submittals and issue SER.

Status Updated: 9/30/82

Multiplant Action Number: D-12

Title: BWR Non Jet Pump Core Spray Performance

Lead Project Manager: P. J. Polk

Priority: 3

Technical Review Branch: ORAB

Statement of Problem:

Core Spray System nozzle coverage differs in a steam environment vis-a-vis an atmospheric environment. The original design is based on atmospheric analyses and tests. The generic issue requires that nozzle coverage be reanalyzed to reflect the steam environment.

Background:

History is inappropriate since only one plant remains outstanding.

Current Status:

All non-Jet Pump BWRs have either made the necessary modifications or committed to same with the exception of Nine Mile Point.

ORAB is presently reviewing the Nine Mile Point submittal in which the licensees concludes that modification of spray nozzles is not required.

Action Required to Complete the MPA:

The Oyster Creek and Nine Mile submittals are currently under review.

Status Updated: 9/30/82

Multi-Plant Action No. D-15

No. of Plants: 70

Title: High Energy Line Break and Consequential System Failure

Priority: 3

Cognizant Assistant Director: T. M. Novak

Cognizant Branch Chief: S. A. Varga

Lead Engineer: M. Grotenhuis

Lead Technical Review Branch EQB, RRAB, GIB

Other Review Branches:

Problem: Certain non-safety grade equipment, if subjected to an adverse environment, could impact the safety analyses and the adequacy of the protective functions performed by safety grade equipment. The NRC is concerned that a potential may exist at operating light water reactor facilities, for an unreviewed safety matter related to the effects of the environment on control systems resulting from high energy line breaks inside or outside containment and the results of these effects on the required safety systems.

Background:
On September 17, 1979, the NRC requested that all LWR licensees review their plants to determine whether control system failures caused by high energy line breaks (HELB) could result in consequences more severe than previously analyzed for the HELB. All licensees responded in a timely manner (20 days). A status reported from D. G. Eisenhut to H. Denton dated October 15. 1979 provided a basis for continuing operation. A meeting with representatives of the nuclear industry was held on November 9, 1979. A status report P. S. Check to D. G. Eisenhut dated December 19, 1979 stated that the NRC task group had found no specific identified safety problems. There were remaining concerns which fall within the scope of NUREG-0660 II.C.3.

Current Status:

All TAC's issued on this subject are still open. A memo has been prepared which includes instructions to PM's to close the issue and sent a letter to each utility informing them that any continuing effort by the staff will be under NUREG-0660 II.C.3.

Actions Required to Complete the MPA:

D. Eisenhut has received the above memo and has requested a meeting with R. Mattson and S. Hanauer on the matter. Following this each PM would receive the above instructions.

Status Updated: 9/30/82

Multiplant Action No.: D-17

Title: Definition of Operable

Lead Project Manager: Sydney Miner

Priority Medium

Technical Review Branch(es): None

Statement of Problem:

Clarification of the term "OPERABLE" as it applies to support system outages or multiple outages of redundant components.

Background:

In a letter dated April 10, 1980, an explanation of the problem plus accompanying illustrate examples of recommended changes contained in the associated bases, were delineated to all licensees. The licensees were required to submit proposed changes to tech specs applicable to their plant and to implement procedures designed to assure compliance with the specifications containing new requirements.

Current Status:

1. Acceptance Criteria
   The acceptance criteria that LCO should be incorporated in the Technical Specification which requires that the plants be in cold shutdown within 36 to 39 hours if redundant ECCS loops become inoperable either due to failures in redundant ECCS loops or the diesel generators.

2. Important Schedule Considerations
   Five licensing actions were completed last fiscal year. All the remainder are scheduled to be completed this year.
3. Review Responsibilities
   This MPA is being handled completely within the Project Management Organization.

Actions Required to Complete MPA:

1. Remaining Milestones

   (a) Approval of remaining changes to the Technical Specifications of the remaining plants.

   (b) Issuance of the SER and the License Amendments.

2. Plant Actions Remaining

   There are 16 remaining licensing actions.

Status Updated: 9/30/82

Multiplant Action Number: E-04

Title: BWR Single Loop Operating

Lead Project Manager: Dick Clark

Priority: Low

Technical Review Branches: RSB, CPB

Statement of Problem:

The standard BWR Technical Specifications do not permit a plant with two recirculation loops to operate either with one loop or in the natural circulation mode. Fifteen operating BWRs have requested approval to operate at reduced power levels with a single loop if problems develop with a jet pumb, valve, seals, flow controller, etc., in the other loop. Most of the potential safety reviews can more appropriately be resolved on a generic basis.

Background

Single loop operation at limited power levels had previously been authorized for 6 BWRs for short periods of time (one week to two months). Based on this operating experience, the staff has concluded that BWRs can be safely operated at 50% power by natural circulation (i.e., without forced flow from any recirculation loop). Accordingly, as an interim measure, for those licensees who modified their application, the plants have been authorized to operate, if necessary, at power levels of 50% with a single recirculation loop. For operation above 60% power, there is a generic concern involving flow stability when operating with one rather than two recirculation loops.

Current Status:

A meeting was held October 22, 1981 with all BWR licensees and GE to discuss GE's evaluation of Browns Ferry's and other BWR operating expericnce with single loop operation. RSB and CPB have prepared a draft list of questions which we discussed in a meeting with GE on January 21, 1982. Pending resolution of the generic concersn on thermal hydraulic stability, the review of applications for single loop operation at power levels above 50% is on hold. The review of applications for operating at 50% power has been completed on six applications and is nearing completion on the other nine applications.

Actions Required to Complete the Licensing Action:

Complete reviews on applications for single loop operation at 50% power. For those licensees requesting approval to operate on a single loop at power levels greater than 50%, transmit requests for additional information to licensees. Review and evaluate responses. Prepare safety evaluations authorizing plants to operate on a single loop at power levels indicated by the revised ECCS analysis.

Status Updated: 9/30/82

Multi-Plant Action No. E-05
No. of Plants: 3
Title: Westinghouse N-1 Loop Operation
Priority: Low
Cognizant Assistant Director: G. C. Lainas
Cognizant Branch Chief: S. Varga
Lead Engineer: D. Wigginton
Lead Technical Review Branch: RSB
Other Review Branches: ICSB

Problem:

All Westinghouse plants have a provision in their license that prohibits operation with less than all loops (N) in service.

Background:

It may be desirable to operate plants with one loop out of service. Present restrictions in the license do not permit this type of operation.

Current Status:

Only three Westinghouse plants, Beaver Valley and Zion (1 and 2), have submitted proposed amendments for N-1 loop operation. Beaver Valley is lead plant and most of the review has been completed. Trojan, a plant without loop isolation valves, has expressed an interest in submitting an application.

Action(s) Required to Complete the Licensing Action:

NRC to review contractor (Franklin Inst., Lawrence Livermore) inputs and write SER on Beaver Valley. Zion review to follow. Other Westinghouse pLants will probably submit similar applications if Beaver Valley is approved.

OPERATING REACTORS LICENSING ACTIONS SUMMARY

Date Completed: December 1982
Date Published: December 1982

Prepared for: OFFICE OF NUCLEAR REACTOR REGULATION

Prepared by: OFFICE OF RESOURCE MANAGEMENT
U.S. NUCLEAR REGULATORY COMMISSION
WASHINGTON, D.C. 20555

FOREWORD

THE OPERATING REACTORS LICENSING ACTIONS SUMMARY IS DESIGNED TO PROVIDE THE MANAGEMENT OF THE NUCLEAR REGULATORY COMMISSION (NRC) WITH AN OVERVIEW OF LICENSING ACTIONS DEALING WITH OPERATING POWER AND NONPOWER REACTORS. THESE REPORTS UTILIZE DATA COLLECTED FROM THE DIVISION OF LICENSING IN THE OFFICE OF NUCLEAR REACTOR REGULATION AND ARE PREPARED BY THE OFFICE OF MANAGEMENT AND PROGRAM ANALYSIS.

THIS SUMMARY REPORT IS PUBLISHED PRIMARILY FOR INTERNAL NRC USE IN MANAGING THE OPERATING REACTORS LICENSING ACTIONS PROGRAM. ITS CONTENT WILL CHANGE BASED ON NRC MANAGEMENT INFORMATIONAL REQUIREMENTS.

TABLE OF CONTENTS

Definitions I-III

Section 1 Management Overview Report

A. Plot of Total Active Routine Actions by Month A1

B. Plot of New Actions by Month B1

C. Plot of Completed Actions by Month C1-C2

D. Routine Licensing Actions by Month D1-D2

E. Routine Licensing Actions - Power Reactors E1-E3

F. Routine Licensing Actions - Nonpower Reactors F1-F2

G. Manpower Summary by Facility G1-G3

H. Multi-Plant Issues Summary Report H1-H4

I. Multiplant Actions - Lead Assignments and Contract Information I1-I12

J. Operating Reactors Hearing Summary J1-J5

K. Completed Licensing Actions by Fee Class K1

L. FY to Date Multi-Plant Specific Action Summary L1

M. Multiplant Action Completion Schedule M1-M7

N. Requests for NRR Assistance - Status Report N1-N7

Section 2 TMI Licensing Actions

A. Plot of Total Active TMI Actions by Month A1

B. Plot of New TMI Actions by Month B1

C. Plot of Completed TMI Actions by Month C1

D. TMI Licensing Actions by Month D1-D2

E. TMI Power Reactors Licensing Actions E1-E3

F. Status of NUREG-0737 Requirements Schedule F1-F13

G. NRR Implementation Review Completion Status G-1

Section 3 Licensing Action by Power Reactor Condensed Management Report 1-146

Section 4 Multiplant Action Descriptions for Active Issues

Definitions

I. Licensing Actions

- A. Active Licensing Action - an item which has been initiated but not completed.
  1. Multi-Plant Licensing Action - a licensing action topic that applies to a class of reactors.
  2. Plant Specific Licensing Action - a licensing action associated with a certain facility because of the uniqueness of the technical specifications or situation, e.g., reduce the number of incore detectors.
- B. Types of Licensing Actions
  1. Amendment - action that results in changes to facility licenses including technical specification changes.
  2. Letters to Licensees - letters sent to licensee requesting information that will resolve or aid in the resolution of technical issues. Examples of letters sent to licensees are: fuel handling inside containment, assymmetric loads or reactor vessel materials surveillance.
  3. Orders/Exemptions - actions on operating plant that result in an Order for Modification of a License or an exemption to the regulation.
- C. Categories of Multiplant Actions
  1. Regulation - actions directly attributed to a specific regulation requirements, e.g., inservice inspection/testing requirements 10 CFR 50.55a(g).(A-Series)
  2. Operating Experience - action directly attributed to an occurrence of accumulative experience at licensed reactors e.g., fire protection. (B-Series)
  3. Internal Review - action resulting from NRC staff reviews of license applications, generic topics and operating reactor licensing actions, e.g., reporting requirements, fuel handling accidents, or filter tech spec requirements. (C-Series)

4. New Information - action required as a result of current data which shows that previously accepted requirements are no longer acceptable or are overly restrictive, e.g., ECCS input errors, assymmetric loads, equipment qualification. This new information may result from technological advancements, research or advanced analytical studies. (D-Series)
5. Licensee Requests - action requested by the licensee that does not fit any of the other sources of licensing actions. Usually these actions are requested because of the licensee's desire to improve operational performance, e.g., core reloads, spent fuel pool modifications, or (N-1) loop operation.(E-Series)
6. TMI Related Actions - actions related to the TMI Action Plan. (F-Series)

II. Significant Dates

A. Initiation - This is the date an action was actually started or implementation was begun on a plant. It is the date that a letter was issued to the licensee initiating the action, the date of an amendment request, or the date a TAC was issued for an item arising out of an operating experience or new information event.

B. PM-Target - project manater's anticipated completion date for active items.

C. Licensing Action Complete - date on which all work, both technical and administrative was completed and sent out of the agency.

III. Definition of Priorities (Applicable to Multi-Plants or Plant Specific Actions)

A. High (1)

1. Required by Rule, Order or NRC Letter
2. Safety-related items that use definite improvements in safety or would reduce the likelihood of transients or accidents.
3. Hearing-related matters.
4. High public interest in issue.
5. Actions which, if not completed, will affect power level or scheduled restart of a facility.
6. § 2.206 petitions.

B. Medium (2)

   1. Items which, if not completed could result in an otherwise unnecessary IE enforcement action.
   2. Spent fuel pool expansions.
   3. Task should be completed within six months.

C. Low (3)

   1. Licensee requests for amendments that have low safety significance.
   2. Licensee requests for amendments which may have safety significance but for which NRC action is not required during the next six months (e.g., in early submittal of a core reload).

OPERATING REACTORS HEARING SUMMARY

Facility	Project Manager	Hearing Attorney	Subject	Initiation Date	Status
Big Rock Point	R. Emch	M. Karman	Mixed Oxide Fuel	8/75	In indefinite suspension as a result of GESMO decision.
Big Rock Point	R. Emch	J. Moore	Spent Fuel Pool Expansion	9/25/79	Evidentiary hearing held 6/7/82-6/12/82, which covered about 40% of the contentions. Additional evidentiary hearings have not yet been scheduled for the remaining contentions.
Browns Ferry 1/2/3	R. Clark	R. Rawson	Onsite Storage of Low Level Waste	1/81	ASLB denied petitions to intervene. Appeal Board remanded issue back to ASLB and reinstated intervenors. Staff and TVA appealed decision to the Commission. Commission remanded issue back to Appeal Board. Prehearing conference held April 1, 1982 in Huntsville, AL. SER and EIA issued June 4, 1982 and June 9, 1982 respectively. Intervenors and TVA are discussing "out-of-court" settlement of issues.

OPERATING REACTORS HEARING SUMMARY

Facility	Project Manager	Hearing Attorney	Subject	Initiation Date	Status
GETR	C. Nelson	D. Swanson	Seismic Show Cause Issues	10/24/77	Testimony completed, awaiting Initial Decision.
Ginna	J. Lyons	M. Young	Full Term Operating License Conversion	6/8/73	We anticipate that the evidentiary hearing for the POL Conversion to FTOL will be held in the Summer of 1983.
Humboldt Bay	V. Rooney	M. Young	Deletion of Seismic Conditions	7/29/77	Motion to withdraw application for license amendment and to terminate the proceeding filed by the licensee on December 31, 1980 By memorandum and order dated February 17, 1982 the ASLB ordered the licensee to file status reports each 3 months. The ASLB also ordered that 6 months after the Commission reaches a decision on safety goals and issues guidelines the licensee must report to the Board (a) readiness to take actions to permit resumed operation, or (b) commit to submit a decommissioning plan.
Indian Point 2/3	J. Hannon	J. Moore	Risk Assessment of Plant	10/1/82	Hearing will begin on January 10, 1983 and staff witnesses are expected to appear 1/18/83. Hearing is contemplated to be completed 4/27/83.

OPERATING REACTORS HEARING SUMMARY

Facility	Project Manager	Hearing Attorney	Subject	Initiation Date	Status
LaCrosse	R. Dudley	C. Woodhead	Full Term Operating License (with seismic considerations)	6/23/78	With respect to environmental contentions, by Memorandum and Order dated August 2, 1982, the ASLB granted staff and applicant motions for summary disposition of all intervenor's environmental contentions, the Board directed the staff to correct the FES on matters involving energy alternatives. The proceeding also involve seismic issue from Show Cause (2.206) proceeding with FTOL proceeding. The FTOL proceeding is contingent upon the completion of the SEP for the facility.
Maine Yankee	K. Heitner	J. Gutierrez	Spent Fuel Pool Capacity Expansion	9/18/78	First Prehearing Conference completed. Two intervenors admitted. April 12, 1982 ASLB Order admits 14 contentions. June 16 1982 SER & FEIS issued. ASLB Order of July 20, 1982 schedules hearing for June 7, 1983. August 30, 1982 - Additiona contentions from intervenors - September 30, 1982 Applicant & staff replies to contentions & intervenors response. October 22, 1982 remaining SER Open Items closed. ASLB ruling delayed until approximately December 10, 1982.
North Anna 1/2	L. Engle	D. Swanson	Turbine Missile Risk	2/27/78	On June 2, 1982, the ASLAB issued ALAB-676 wherein the Appeal Board delineated its decision resolving the North Anna Turbine Missile Issue. All issues in this proceeding are terminated other than the radon emissions in the milling & mining of uranium fuel. The radon issue will be addressed following resolution in other hearings which are contested.

OPERATING REACTORS HEARING SUMMARY

Facility	Project Manager	Hearing Attorney	Subject	Initiation Date	Status
North Anna 1/2	L. Engle	D. Swanson	Spent Fuel Pool Capacity Expansion	12/8/82	Pursuant to 10 CFR §2.751a, a notice of hearing was issued on December 8, 1982 by the ASLB scheduling a prehearing conference to be held February 16, 1983 to consider VEPCO's proposed amendments to the NA 1/2 Operating License regarding the transfer and storage of Surry spent fuel at NA and the expansion of the NA spent fuel storage capacity. The prehearing conference will identify key issues, consider intervention petitions and determine appropriate further actions.
Point Beach 1	T. Colburn	R. Bachmann	Demonstration Tube Sleeving	7/20/81	Final ASLAP decision issued 10/1/82 supporting ASLB decision. Complete, time for Commission action has expired.
Point Beach 1/2	T. Colburn	R. Bachmann	Steam Generator Tube Sleeving	7/20/81	Staff EIA & SER issued on 6/30/82 and 7/8/82, respectively. Staff filed motion for summary disposition on 9/3/82 in response to intervenor's motion concerning litigable issues dated 8/20/82. ASLB ruled on summary disposition 10/1/82 memorandum and order. One generic issue admitted. Hearing scheduled for 11/17/82-11/20/82. Hearing concluded 11/18/82. Findings of fact due 12/20/82, 12/30/82, and 1/20/83 for licensee, intervenor and staff respectively. Decision due to be filed 1/30/83.
Point Beach 1	T. Colburn	R. Bachmann	Steam Generator Replacement	8/10/82	Intervenor filed request for hearing dated 8/10/82. ASLB established prehearing conference set for 11/20/82. Prehearing conference held 11/19/82, intervenor forfeitted attendance.

OPERATING REACTORS HEARING SUMMARY

Facility	Project Manager	Hearing Attorney	Subject	Initiation Date	Status
Rancho Seco	S. Miner	R. Black	Commission Order of May 7, 1981, related to TMI Related Modifications	5/15/79	Initial Decision of ASLB under review by ASLAB sua sponte.
Three Mile Island 1	R. Jacobs	J. Gray J. Cutchin J. Goldberg	TMI-1 Restart	8/79	All Partial Initial Decisions issued; before the Commission for determination of immediate effectiveness. ASLAB also reviewing all ASLB PIDs.
Robinson 2	G. Requa	S. Treby	Radon	11/30/82	Partial Initial Decision issued by ASLB; affirmed by ALAB on October 31, 1979 (ASAL-569). Pending before ASLAB on radon only.

Section 4

Multiplant Action Descriptions for Active Issues

Multiplant Action Number: A-01

Title: 10 CFR 50.55a(g) ISI

Cognizant Assistant Director: G. Lainas
Cognizant Branch Chief: S. Varga

Lead Project Manager: P. Tam

Priority: 1

Technical Review Branch(es): MTEB

Statement of Problem:

Licensees for boiling or pressurized water-cooled nuclear power facilities are required by 10 CFR 50.55a(g) to have an inservice inspection program that meets the requirements of Section XI of the ASME Boiler and Pressure Vessel Code and Addenda (The Code). If the licensee determines that it is impractical to meet certain requirements of the Code, justification must be provided to the Commission, which can grant relief from specific Code requirements or impose alternate requirements.

Background:

Staff review is currently several years behind originally planned schedules. The staff has previously given interim implementation guidance to the licensees by letter. In general, this guidance authorized the licensees to implement their ISI plans as proposed pending completion of review by the staff. In some cases the period for which the proposed plans and interim implementation authorization would apply has expired and the licensees have made subsequent submittals before the staff completed review of the original plan.

Current Status:

The backlog of ISI relief requests has been completed by a contractor (SAI); SERs are being completed by MTEB on a timely basis. After the current backlog is cleared, reviews of requests for relief from code requirements will be conducted on a plant-specific basis with a schedule keyed to inspection program update requirements.

Actions Required to Complete the MPA:

Twenty six SERs remain to be completed in FY83; 35 licensing actions to be completed in FY83.

Status Updated: 12/7/82

Multi-Plant Action No. A-02

No. of Plants: 73

Title: Appendix A - ALARA

Priority: 1

Cognizant Assistant Director: G. C. Lainas

Cognizant Branch Chief: J. F. Stolz

Lead Engineer: P. C. Wagner

Lead Technical Review Branch Effluent Treatment Systems Branch

Other Review Branches: Radiological Assessment Branch

Problem:

Implementation of Technical Specifications called for in 50.36a and Appendix I to 10 CFR 50.

Background:

Appendix I was published in 1975 and Model TS were sent to all licensees on 7/78, 11/78 and 7/79. Submittals have been received from all licensees except Kewaunee.

Current Status:

Action completed on 4 plants (Farley 2, Sequoyah, McGuire and TMI-1). Site visits are being conducted to discuss RETs implementation. No TERs or SERs have been received, from either FRC or EG&G both of whom have been contacted for these reviews

Action(s) Required to Complete the Licensing Action:

1. Contractor and NRR visits to each site to discuss RETs implementation.
2. Contractor provide NRR with updated SERs and negotiated TS.
3. DL issue license amendment.

Status Updated: 12/13/82

Multiplant Action Number: A-04

Title: Containment Leak Testing - Appendix J

Cognizant Assistant Director: F. Miraglia
Cognizant Branch Chief: D. Crutchfield

Lead Project Manager: W. Paulson

Priority: 1

Technical Review Branch: CSB

Contractor: Franklin Research Institute

Statement of Problem:

Some operating plants may not be in full compliance with Appendix J to 10 CFR Part 50.

Background:

Appendix J to 10 CFR Part 50 was published after many nuclear power plants had either received their operating license or their containments had reached an advanced state of design of construction. Accordingly, some plants may not be in full compliance with Appendix J. Licensee submittals, including exemption requests and proposed Technical Specifications need to be reviewed.

Current Status:

Franklin Research Center performed the review of the 47 remaining plants in this program under contract. All 46 TERs have been received from Franklin Research Institute. No TER is expected for Dresden 1 which is on hold. All 46 SERs have been forwarded to DL by CSB. Twenty-nine licensing actions have been completed.

Actions Required to Complete the MPA:

ORPMs are working on the remaining SERs in preparation for issuance.

Status Updated: 11/30/82

Multiplant Action Number: A-10

Title: Contingency Planning

Cognizant Assistant Director: F. Miraglia
Cognizant Branch Chief: C. Thomas

Lead Project Manager: E. McPeek

Priority: High

Technical Review Branch(es) ______________________________

(Primary)	Power Reactor Safeguards Licensing Branch, NMSS
(Secondary)	Standardization and Special Projects Branch, NRR

Statement of Problem:

Development of a plan to specify for licensee personnel specific objectives which they must achieve to detect and deter threats, thefts or radiological sabotage for all NRC licensed commercial power reactors.

Background:

NRC Rules, as stated in 10 CFR Parts 50 and 73, require each utility licensed by the NRC to operate a commercial power reactor to submit for NRC approval and to implement a safeguards contingency plan.

Current Status:

1. Acceptance criteria have been developed and are stated in the following:

   a. 10 CFR Part 73, Appendix C
   b. Regulatory Guide 5.44
   c. Review Guideline 24

2. The Power Reactor Safeguards Licensing Branch, NMSS has the lead responsibility for reviewing the plans from a safeguards viewpoint. The Standardization and Special Projects Branch has the lead responsibility for reviewing the plans from a plant safety viewpoint.

3. No contractors are utilized in this licensing review.

Action Required to Complete the MPA:

1. For operating power reactors all plans have been reviewed and four (2) remain to be approved. The NMSS staff has provided, through the appropriate NRR Project Manager, specific comments for consideration and action by the licensees. Once these issues are resolved, license amendments will be issued.

2. For applicants for operating licenses, the NMSS staff has taken review actions designed to complete the review and acceptance of each plan prior to the target date of the issuance of the SER.

Status Updated: 12/13/82

Multiplant Action Number: A-11

Title: Guard Training Plans

Cognizant Assistant Director: F. Miraglia
Cognizant Branch Chief: C. Thomas
Lead Project Manager: E. McPeek

Priority: High

Technical Review Branch(es)

(Primary) Power Reactor Safeguards Licensing Branch, NMSS

(Secondary) Standardization and Special Projects Branch, NRR

Statement of Problem:

Development of a plan to specify an acceptable level of training to be provided to the licensee's security force for implementation at all NRC licensed commercial power reactors.

Background:

NRC Rules, as stated in 10 CFR Parts 50 and 73, require each entity licensed by the NRC to operate a commercial power reactor to submit for NRC approval and to implement a security force training and qualification plan.

Current Status:

1. Acceptance criteria have been developed and are stated in the following:
    a. 10 CFR Part 73, Appendix B
    b. NUREG-0674
    c. NUREG-0219
    d. NUREG-0576
2. The Power Reactor Safeguards Licensing Branch, NMSS has the lead responsibility for reviewing the plans from a safeguards viewpoint. The Standardization and Special Projects Branch, NRR has the lead responsibility for reviewing the plans from a plant safety viewpoint.
3. No contractors are utilized in this licensing review.

Actions Required to Complete the MPA:

1. For operating power reactors all plans have been reviewed and two (2) remain to be approved. The NMSS staff, through the appropriate NRR Project Manager, has provided specific comments for consideration and action by the licensees. Once these issues are resolved license amendments will be issued..
2. For applicants for operating licenses, the NMSS staff has taken review actions designed to complete the review and acceptance of each plan prior to the target date of the issuance of the SER.

Status Updated: 12/13/82

Multiplant Action Number: A-14

Title: 10 CFR 50.55a(g) Inservice Testing

Cognizant Assistant Director: G. Lainas
Cognizant Branch Chief: S. Varga
Lead Project Manager: P. Tam

Priority: 1

Technical Review Branch(es): MEB, R-I, R-II, R-III, R-IV, R-V, ORB #3

Statement of Problem:

Licensees for boiling or pressurized water-cooled nuclear power facilities are required by 10 CFR 50.55a(g) to have an inservice testing program that meets the requirements of Section XI of the ASME Boiler and Pressure Vessel Code and Addenda (The Code). If the licensee determines that it is impractical to meet certain requirements of the Code, justification must be provided to the Commission, which can grant relief from specific Code requirements or impose alternate requirements.

Background:

Staff review is currently several years behind originally planned schedules. The staff has previously given interim implementation guidance to the licensees by letter. In general, this guidance authorized the licensees to implement their IST plans as proposed pending completion of review by the staff. In some cases the period for which the proposed plans and interim implementation authorization would apply has expired and the licensees have made subsequent submittals before the staff completed review of the original plan.

Current Status:

The backlog of IST relief requests is being reviewed by the above named organizations. After the current backlog is cleared, reviews of requests for relief from Code requirements will be conducted on a plant specific basis with a schedule keyed to testing program update requirements. Thirty-six of the backlog facilities are being reviewed by the regions.

Actions Required to Complete the MPA:

Thirty-four SERs remain to be completed in FY83; 35 licensing actions to be completed in FY83.

Status Updated: 12/7/82

Multi-Plant Action No. B-04

No. of Plants: 37

Title: Reactor Vessel Overpressure Protection

Priority: 2

Cognizant Assistant Director: G. C. Lainas

Cognizant Branch Chief: J. F. Stolz

Lead Engineer: A. W. DeAgazio

Lead Technical Review Branch RSB*

Other Review Branches:

Problem:
Prevent overpressurizing the reactor vessel when at low temperature. Applicable to PWRs only.

Background:
A number of events have demonstrated that administrative controls alone are not adequate to prevent low-temperature overpressure events at PWRs. All PWRs were requested to provide an overpressure protection system that is to be used when the plant is in a low-temperature shutdown condition.

Current Status:

All plants implemented their system with preliminary NRC approval followed by post implementation review of (a) electrical aspects; (b) reactor system aspects; and (c) Technical Specifications. Ten plants remain for which licensing actions is required. SERs are available for four of the plants with only PM processing required. The remaining six plants are being reviewed by RSB. Previous contracts through ORAB have generated TERs for electrical aspects.

Actions Required to Complete the MPA:

Complete SERs for the six plants. Review Tech Specs by PM and lead PM. Issue Tech Specs and SERs for remaining plants.

Status Updated: 12/13/82

---

*ORPMs responsible for integrating existing electrical, instrument and control TER with RSB's review.

Multiplant Action Number: B-05 (USI A-42)

Title: Stress Corrosion Cracking - Implementation of NUREG-0313, Rev. 1
Cognizant Assistant Director: G. Lainas
Cognizant Branch Chief: D. Vassallo
Lead Project Manager: Dick Clark
Priority: High

Technical Review Branches: ORAB, MTEB

Statement of Problem:

Leaks and cracks in the heat-affected zones (HAZs) of welds in BWR austenitic stainless steel piping and components have been observed since the mid-1960's. All the cracks have been attributed to intergranular stress corrosion cracking (IGSCC). The revised purpose of this task is to insure that all BWRs have adequate programs--as defined in NUREG-0313, Rev. 1--to: (1) design systems constituting the reactor coolant system pressure boundry (RCSPB) to minimize the potential for IGSCC, (2) select materials for the RCSPB resistant to IGSCC, (3) control the water chemistry environment so as to reduce the potential for intergranular corrosion, (4) detect potential cracking through augmented inspections before it develops into a through-wall leak, and (5) detect possible RCSPB leakage before it becomes significant.

Background:

In 1975 NRC (AEC) formed a Pipe Cracking Study Group (PCSG) to investigate the cause of cracking in BWR piping. In July 1977 the staff issued an implementation document, NUREG-0313, based on recommendations of the PCSG. As a result of cracking in large diameter pipes and in nozzles which had not been observed prior to 1975, a new PCSG was activated in September 1978. In October 1979 Revision 1 to NUREG-0313 was issued for comment; this contained the latest recommendations of the Study Group. Based on industry comments, the document was modified and reissued. In view of the revised staff acceptance criteria, the previous reviews were terminated (TACs 08207 through 08230 plus 11263). New TACs have subsequently been issued (TACs 46651-46674) to cover the revised review effort.

Current Status:

In February 1981 NUREG-0313, Rev. 1 was issued to all holders of BWR operting licenses or construction permits and to all applicants for operating licenses. By July 1, 1981 the applicants/licensees were to provide their program for replacement of service sensitive lines and welds, their program for augmented inservice inspection, their program for improving the water chemistry environment and incorporation of adequate leak detection capability. These submittals are being reviewed by EG&G Idaho under a technical assistance contract, Request for additional information were sent to licensees for 15 plants; the draft TERs are being prepared on this group. The licensees for 7 plants adopted a position that since significant cracking had not been detected in their facilities, the augmented programs in NUREG-0313 Rev. 1 were not warranted; resolution of this position has necessitated a rescheduling of the TERs on some plants until the fourth quarter of FY83.

Multiplant Action Number - B-05 (USI A-42) cont'd

Actions required to Complete the Licensing Action:

Review of individual applicant and licensee responses to determine if they meet the guidelines published in NUREG-0313, Rev. 1. These reviews were initiated in May 1982. Priority is being given to completing the reviews on those BWRs with furnace sensitized safe ends. A total of 24 reviews need to be completed for operating reactors, all of which are scheduled for completion in FY83.

Status Updated: 12/8/82

Multi-Plant Action No. B-17

No. of Plants: 60

Title: Tech Spec Surveillance for Hydraulic Snubbers

Priority: 1

Cognizant Assistant Director: G. C. Lainas

Cognizant Branch Chief: R. A. Clark

Lead Engineer: Leon B. Engle, ORB #3

Lead Technical Review Branch See Current Status Below

Other Review Branches:

Problem: Operability of snubbers for LWRs is required to provide assurance that the structural integrity of the reactor coolant system and all other related systems is maintained during and following a seismic or other event initiating dynamic loads. OPERABILITY is verified by an Inservice Inspection and Testing Surveillance program specified in plant Technical Specifications (TS). Recent operating experience has indicated the need for changes, clarifications and improvements in the Inservice Surveillance Requirements for hydraulic snubbers.

Background:

By letter dated November 20, 1981, the NRC requested that all power reactor licensee's (except SEP) incorporate the model NRC TS in plant specific Appendix A TS. A similar request was sent to SEP operating licensees on March 23, 1981. The NRC TS require that the visual inspection frequency be based upon maintaining a constant level of snubber protection to systems. In order to provide assurance of hydraulic snubber functional reliability, a representative sampling of plant installed snubbers must be functionally tested during plant shutdowns at 18 month intervals. The required sampling provides a confidence level of 95% that 90% to 100% of plant specific snubbers will be OPERABLE within acceptance limits.

Current Status:

In October 1982, management decided to transfer the remaining B-17 actions to the Regions. Upon official transfer, review schedules will be established with the Regions (approximately 45 days) so that the remaining units (38) for B-17 will be scheduled for completion in the 2nd, 3rd, and 4th quarters, FY-83.

Status Updated: 12/12/82

Multi-Plant Action No. B-22

No. of Plants: 66

Title: Tech Spec Surveillance for Mechanical Snubbers

Priority: 1

Cognizant Assistant Director: G. C. Lainas

Cognizant Branch Chief: R. A. Clark

Lead Engineer: Leon B. Engle, ORB #3

Lead Technical Review Branch See Current Status Below

Other Review Branches:

Problem:

OPERABILITY of snubbers for LWRs is required to provide assurance that the structural integrity of the reactor coolant system and all other related systems is maintained during and following a seismic or other event initiating dynamic loads. Operability is verified by an Inservice Inspection and Testing Surveillance program specified in plant Technical Specifications (TS). Prior to initiation of MB-22, mechanical snubbers had not been included in operating plant surveillance programs. Recent operating experience has indicated that mechanical snubbers require OPERABILITY requirements similar to those required for hydraulic snubbers.

Background:

By letter dated November 20, 1981, the NRC requested that all power reactor licensee's (except SEP) incorporate the model NRC TS for mechanical snubbers in plant specific Appendix A TS. A similar request was sent to SEP operating licensees on March 23, 1981. The NRC TS require that the visual inspection frequency be based upon maintaining a constant level of snubber protection to systems. In order to provide assurance of mechanical snubber functional reliability, a representative sampling of plant installed snubbers must be functionally tested during plant shutdowns at 18 month intervals. The required sampling provides a confidence level of 95% that 90% to 100% of plant specific snubbers will be OPERABLE within acceptance limits.

Current Status:

In October 1982, management decided to transfer the remaining B-22 actions to the Regions. Upon official transfer, review schedules will be established with the Regions (approximately 45 days) so that the remaining units (32) for B-22 will be scheduled for completion in the 2nd, 3rd, and 4th quarters, FY-83.

Status Updated: 12/12/82

Multiplant Action Number: B-23

Title: Potential Equipment Failures Associated with Degraded Grid Voltage

Cognizant Assistant Director: F. Miraglia
Cognizant Branch Chief: D. Crutchfield
Lead Project Manager: R. Dudley
Priority:

Technical Review Branch(es): Power Systems Branch

Statement of the Problem:

Potential exists for supplying safety and non-safety equipment with voltage outside the range for which it was designed for longer than transient periods. Such conditions could result in safety-related equipment being unavailable to mitigate the consequences of an accident.

Background:

On July 20, 1976, Northeast Nuclear Energy Company (NNECo) reported that, following a trip of Millstone Unit No. 2 on July 5, 1976, several motors powered from 480 volt (v) motor control centers failed to start as required. The failure of the 480 v motors to start was traced to blown control power fuses on the individual motor controllers. These controllers received control power through 480 v/120 v transformers within the controller.

NNECo's investigation disclosed that, as a result of the plant trip, the grid voltage dropped from 352 kv to 333 kv. This voltage drop, in conjunction with additional voltage drops associated with the transformers involved, reduced the control power and voltage within individual 480 v controllers to a voltage which was insufficient to actuate the main line controller contractors. As a result, when the motors were signalled to start, the control power fuses were blown. Subsequent testing by NNECo showed that the contractors required at least 410 v to function properly.

NNECo concluded that under similar low voltage conditions, the operability of 480 v Engineered Safety Feature equipment could not be assured.

NNECo's immediate corrective action was to raise the setpoint of the Engineered Safeguards Actuation System (ESAS) "loss of power" under-voltage relays to assure that the plant would be separated from the grid and that emergency power system (dual) operation would be initiated before the control voltage fell below that required for contractor operation. A trip of the under-voltage relays causes the emergency buses to be de-energized and a load shed signal to strip the emergency buses, the diesel generators to start and power the emergency buses, and required safety related loads to sequence start on the buses.

Background (Cont'd)

On July 21, 1976, NNECo reported that the earlier corrective action taken was no longer considered appropriate because during starting of a circulating water pump, the voltage dropped below the new ESAS undervoltage relay setting. This de-energized the emergency buses, caused load shedding to occur, started the diesel generators and began sequencing loads onto the emergency buses in accordance with the design. However, during sequencing of the loads onto the buses, the voltage again dropped below the undervoltage relay setting which caused the load shed signal to strip the buses. The result was energized emergency buses with no loads supplied.

Current Status:

All utilities operating plants (BWR, PWR, HTGR) licensed prior to 1976 must provide under-voltage relays which separate the plant from the grid (in case of degraded grid voltage) and activate the plant emergency power system. The current DL schedule requires this item to be completed in FY-1983. Technical review is provided by the Power Systems Branch, with contractor technical support from Lawrence Livermore Lab and EG&G.

67 - operating plants covered by B-23
67 - SERs completed(14 of which have open items)
53 - Licensing Actions completed

Actions Required to Complete the MPA:

Complete the 14 remaining SERs. Complete the 14 remaining licensing actions.

Status Updated: 12/10/82

Multi-Plant Action No B-24*
*B-20 integrated into B-24 on 8/25/80

No. of Plants: 66

Title: Venting and Purging Containment While at Full Power and Effect of LOCA

Priority: High

Cognizant Assistant Director: G. Lainas

Cognizant Branch Chief: S. Varga

Lead Project Manager E. Reeves, ORB#1, DL

Lead Technical Review Branch: CSB/DSI, M. Fields

Other Review Branches: EQB/DE, ORAB/DL & AEB/DSI

Problem:

Purging and/or venting of reactor containment buildings with reactor coolant temperature above 200°F may result in LOCA site boundary doses exceeding 10 CFR 50 Part 100 limits.

Background:

Events at Millstone 1 and Salem 1 (where the automatic high radiation closure of purge valves was overridden by operators) resulted in a generic letter being sent to all licensees of operating reactors in November 1978. A report was also made to Congress (#78-05). NRC advised of the events, requested licensees take action to minimize purge and vent operations, and requested response to SRP 6.2.4 and CSB BTP 6-4. In October 1979 an Interim Position was developed by the staff and licensees were requested to conform to it pending completion of our long-term review. In August 1980 generic item B-20 Leakage of Resilient Seals for purge and vent valves was integrated into the B-24 issue. A staff position to require Technical Specifications (as a leakage surveillance at either 3-months or 6-months intervals depending on valve usage) was developed and is included in the guidance being provided to licensees as specific plant reviews progress.

Current Status:

1. All licensees have responded to the November 1979 request for information. Reviews of licensee submittals are still underway although TMI-2 and the April 1980 reorganization of NRR caused delays. All licensee's responses to the October 1979 Interim Position have been reviewed and found acceptable as an interim measure. IE is monitoring licensees for continued compliance with these interim commitments pending completion of the long-term NRR reviews.

2. The Lead Project Manager has issued guidance in memoranda dated August 25, 1980, March 24, 1981 and July 3, 1982 to all OL OR Branch Chiefs & PMs and to the Technical Review Team. The August 25, 1980 memorandum identified the new TACS, the reviewers and assignments to assure continuation of reviews during the NRR reorganization period after April 1980. Later status and guidance is described in item 4 below.

3. Contracts are/were managed by the Technical Review Team as follows:

   a. Electrical Reviews were managed by ORAB/DL with contracts to EG&G, Inc., Idaho and LLNL San Ramon, and FRC, Philadelphia. SEP reviews were managed by SEP with contract to EG&G Idaho.

   b. Valve operability reviews are managed by EQB/DE with contract to BNL.

   c. CSB 6-4 Review requirements were managed by CSB/DSI with contract to LLNL.

   d. Radiological Impact Reviews were managed by AEB/DSI with contract to EXXON Nuclear Idaho Company, Inc.

4. As of June 8, 1981, a sample letter prepared by ORB#1 (concurred in by CSB/DSI) was provided for issuance to each licensee with the next NRC action letter (either Q's or SER). The sample letter (provided in Lead PM Memorandum dated June 19, 1981 to all Project Managers) contains the NRC position clarifications and sample Technical Specifications to close out the long-term reviews. The overall B-24 review also completed TMI Item II.E.4.2, except for II.E.4.2 Position 5, 6 and 7. (Position 5 is open for Crystal River 3 and Palisades as noted below.) On September 30, 1982, CSB/DSI provided SER's for II.E.4.2.6 and II.E.4.2.7. Project Managers were directed by Lead PM memorandum dated October 22, 1982 to complete all DL action on II.E.4.2 no later than the end of the first quarter FY83.

Actions Required to Complete B-24 and B-20 Licensing Actions:

1. Only two plants (Millstone 2 and North Anna 1) have not been sent the review status letter (now scheduled for issuance by Januaey 31, 1982). These letters contain the staff guidance and any existing staff SER's received to date. Project Manager action is needed.

2. CSB, EQB, AEB and ORAB should complete any remaining plant specific SERs and provide to Project Manager in accordance with the Quarterly Review Schedules. Emphasis should be placed on completing the valve operability reviews on an expedited basis. These reviews are the most time consuming and have the most technical problems especially with valves larger than 20 inch diameter. Technical reviewers are providing a status report to the Lead PM on the SERs during each Quarterly Review Meeting.

3. TMI Item II.E.4.2.5 reviews by CSB have been completed except for Crystal River 3. Licensing action is complete except for Crystal River 3 and Palisades. Project Managers should complete this action.

4. On December 2, 1982, AEB/DSI ussued a response to the BWR Owner's Group letter dated June 14, 1982 relating to NUREG-0737, Item II.E.4.2.7 (Radiation Signal). ORAB/DL

5. Project Managers should review any licensee Technical Specification submittals and issue license amendments as required. Consult with Lead PM if problems occur.

Status Updated: 12/7/82

Multiplant Action Number: B-25

Title: Feedwater and CRD Nozzle Cracking
Cognizant Assistant Director: F. Miraglia
Cognizant Branch Chief: D. Crutchfield
Lead Project Manager: P. O'Conner

Statement of Problem:

BWR feedwater nozzles and control rod drive nozzles have developed cracks due to thermal fatigue.

Background:

The generic issue has been resolved by the 11/13/80 issuance of NUREG-0619 which provided licensees of BWRs with acceptable methods to resolve the issue on a plant-by-plant basis.

Current Status:

Thirteen plants have committed to follow the staff's guidance and have received letters confirming that their proposed action is acceptable. The licensing action is complete on these plants. Each will submit a post-implementation report following completion of their proposed modification.

Ten plants are being reviewed to resolve deviations from NUREG-0619 guidance. Additional information and/or commitments are required from these plants to permit the staff to issue a confirmatory action letter or a show cause order to require compliance with staff requirements. All plants except Vermont Yankee have removed the stainless steel cladding from their feedwater nozzles.

Actions Required to Complete the MPA:

Complete the review of the deviations on the ten remaining plants. Obtain commitments to follow NUREG-0619 guidance of accept the licensees proposed deviations from the NUREG suggestions.

Status Updated: December 8, 1982

Multiplant Action Number: B-41

Title: Fire Protection - Final Tech Specs - Final SER Supplements

Priority: High

Cognizant Assistant Director: G. Lainas

Cognizant Branch Chief: J. Stolz

Lead Project Manager: T. Wambach

Review Branches: CEB, ASB, PSB, ICSB, RSB, PTRB, LQB

Statement of Problem:

Protection of safe, shutdown capability from the adverse effects of fire in any area of the plant. During the OL review of plants licensed prior to July 1976, no in-depth review was performed in this area.

Background:

Fire at Browns Ferry Nuclear Plant in March 1975 disabled redundant safety divisions and normal safe shutdown equipment. NUREG-0050.

Current Status:

10 CFR 50.48 and Appendix R to 10 CFR 50 became effective February 17, 1981. The licensees for 63 units licensed prior to January 1, 1979 and for 3 units licensed after January 1, 1979 have made submittals describing (1) plans and schedules to meet Appendix R, (2) design descriptions of alternative, safe shutdown modifications, and (3) exemption requests from Appendix R. There are 3 units that will make these submittals in the first quarter of 1983.

Action(s) Required to Complete the licensing Action:

The submittals described above for all 69 units must be reviewed and acted upon. This will entail issuing exemptions, exemption denials and SERs approving alternative or dedicated safe shutdown modifications. Review of new OLs is now incorporated in the SRP. Final Tech Specs covering the equipment added as a result of Appendix R must also be issued after the modifications are complete.

Status Updated: 12/08/82

Multiplant Action Number: B-48

Title: Adequacy of Station Electric Distribution Voltage

Cognizant Assistant Director: F. Miraglia

Cognizant Branch Chief: D. Crutchfield

Leak Project Manager: R. Dudley

Priority: 2

Technical Review Branch(es): PSB

Statement of Problem:

This review is intended to determine if the onsite distribution system in conjunction with the offsite power sources has sufficient capacity and capability to automatically start and operate all required safety loads within the equipment voltage rating.

Background:

At Arkansas Nuclear 1, loss of offsite power indicated that the electric distribution systems were inadequate for two unit operation. All utilities were asked to review their distribution systems to see if voltages were adequate.

Current Status:

69 - operating plants covered by B-48
57 - SER's completed (14 of which have open items)
38 - Licensing Actions completed

Actions Required to Complete the MPA:

Complete the remaining 26 SER's.
Complete the remaining 31 licensing actions.

Status Updated: 12/10/82

Multi-Plant Action No. B-57

No. of Plants: 44

Title: Decay Heat Removal Capability

Priority: 2

Cognizant Assistant Director: G. C. Lainas

Cognizant Branch Chief: J. F. Stolz

Lead Engineer: A. DeAgazio

Lead Technical Review Branch RSB for eight plants; ORPMs for four plants

Other Review Branches:

Problem:
To assure redundancy in decay heat removal capability by incorporation of requirements into the Technical Specification.

Background:

Various events at PWRs that have occurred during shutdown conditions have indicated that administrative controls to assure decay heat removal capability have been inadequate. All PWR licensees were requested (in a letter dated June 11, 1980) to incorporate requirements for redundancy into their TSs.

Current Status:

Acceptance criteria are: (1) redundancy in decay heat removal capability must be provided for all modes or temperature ranges of operation, particularly in Modes 4, 5 and 6, and (2) adequate surveillance requirements must be provided. A total of 12 plants remain to be reviewed. Indian Point 2 and 3 have not responded to our original request.

INEL has reviewed the submittals to identify where the proposed TSs, in conjunction with existing TSs, do not conform with our Standard TSs.

Actions Remaining:

Review TER's and determine whether deficiencies are serious enough to warrant additional requests to licensees. If not, issue the license amendment as requested.

Status Updated: 12/13/82

Multiplant Action No. B-58a

No. of Plants: All BWRs

Title: BWR Scram Discharge Volume Technical Specifications

Cognizant Assistant Director: G. Lainas

Cognizant Branch Chief: D. Vassallo

Lead Project Manager: K. Eccleston

Priority: High

Technical Review Branch: ORB#2

Statement of Problem:

Common cause failures of instrument volume level switches. Precursors at Hatch and Brunswick resulted in IE Bulletin 80-14.

Background:

Model Technical Specifications were sent to the industry by letter dated July 7, 1980. Submittals were subsequently received from the affected licensees and have been reviewed by the Franklin Research Center.

Current Status:

NRC contract NRC-03-81-130 has been issued to Franklin Research Center to review licensee submittals and write TERs. Final TERs for all 23 affected plants have been received as of 9/30/82; SERs have been provided for these plants.

Action Required to Complete the MPA:

Issue remaining license amendments upgrading TS.

Status updated: 9/30/82

Multiplant Action No. B-58b

No. of Plants: All BWRs (except LACBWR) - 23

Title: BWR Scram Discharge Volume Long Term Modification

Cognizant Assistant Director: G. C. Lainas

Cognizant Branch Chief: D. B. Vassallo

Lead Project Manager: K. Eccleston

Priority: High

Technical Review Branch: ASB

Statement of Problem:

Concerns raised as a result of the partial failure to scram event at Browns Ferry 3 on June 28, 1980 were documented in the staff's Safety Evaluation Report on the BWR Scram Discharge System dated December 1, 1980. A letter was issued on October 1, 1980 requesting a commitment to conform with revised criteria.

Background:

A letter dated December 9, 1980 forwarded the staff's generic SER with revised criteria. A letter dated March 30, 1981 provided clarification of the requirements for diverse instrumentation.

Current Status:

OMB clearance renewal has been applied for; orders are being routed again for concurrence.

Action Required to Complete the MPA:

Issue orders with model Technical Specifications. Perform post-implementation verification or utilize regional inspectors, as appropriate.

Status updated: 12/10/82

Multi-Plant Action No. B-59

No. of Plants: 70

Title: Masonry Wall Design

Priority: 2

Cognizant Assistant Director: G. C. Lainas

Cognizant Branch Chief: R. A. Clark

Lead Engineer: Charles Trammell

Lead Technical Review Branch SEB, SEPB

Other Review Branches:

Problem:
Inadequate design criteria for masonry walls. Applies to all plants.

Background:
Problem was discovered at Trojan during reviews associated with IEB 79-02 (anchor bolts) and IEB 79-14 (As-built verification). A masonry wall was found which supported numerous safety-related pipes which was not adequate to resist seismic forces. This resulted in the issuance of IE Bulletin 80-11 on May 8, 1980. NRR (SEB) has been assigned the responsibility to review licensee's responses to this Bulletin.

Current Status:

Franklin Research Center has been contracted to review most licensee submittals (exception: Trojan, Cooper, Dresden 1, Humboldt Bay, LaCrosse, Yankee-Rowe). Trojan is being reviewed by SEB. LaCrosse and Yankee-Rowe will be reviewed by SEPB. Dresden 1 and Humboldt Bay are currently in a shutdown status, and will be reviewed by SEB if/when needed. Cooper has no safety-related masonry walls covered by IEB 80-11. Close-out letter for Cooper has been issued (2/17/82). Review schedule and acceptance criteria for review have been established.

Actions Required to Complete the MPA:
62 plants remain to be completed. Eight finished to date. FRC review is active.

Status Updated: 12/7/82

Multiplant Action Number: B-60

Title: Environmental Qualification of Electric Equipment for
Nuclear Power Plants

Lead Project Manager: Jose A. Calvo

Priority: 1

Technical Review Branch: Equipment Qualification Branch

Statement of Problem: All plants are required to meet the Commission Memorandum and Order CLI 80-21 concerning 10 CFR 50, Appendix A, GDC 4.

Background: The issue originated from a 1977 petition from the Union of Concerned Scientists on fire protection and equipment qualification. The multiplant action arose from the Commission Memorandum and Order CLI 80-21. Technical resolution of acceptance criteria were produced from Unresolved Safety Issue A-24.

Current Status: Forty-two (42) Technical Evaluation Reports have been issued by Franklin Research Center. It is anticipated that the remaining twenty-nine (29) Technical Evaluation Reports will be completed by April 1983.

The Equipment Qualification Branch has issued Forty-two (42) Safety Evaluation Reports. It is anticipated that the remaining twenty-nine (29) will be completed by June 1983. The Division of Licensing will complete the transmittal of the forty-two (42) SERs issued by the Equipment Qualification Branch by the end of December 1982. The remaining SERs will be issued as they become available.

The Commission has not yet reached a decision regarding the issuance of the environmental qualification rule. Thus, the June 30, 1982 deadline for completion of Environmental Qualification continues to be suspended pending publication of the final rule.

The Union of Concerned Scientists (UCS) is petitioning the United States Court of Appeals for the District of Columbia circuit to nullify the Commission's rule suspending the June 30, 1982 deadline. The UCS contends that the rule suspending the deadline violates the Administration Procedure Act and the Atomic Energy Act concerning the provisions for providing opportunity for notice & comment and providing notice and opportunity for hearing.

The staff has completed the evaluation of the licensee's justifications for continued operation, for 33 operating plants. These evaluations were performed to determine if the previous conclusions are still valid in light of (1) Additional knowledge gained through the FRC Reviews to date, and (2) the extension of the interim period of operation, due to the Commission Action to suspend the EQ deadline. The results from these evaluations will be reflected in the SER for Equipment Environmental Qualification for each plant.

B-60 cont.

Actions Required to Complete the MPA:

The schedule for completion of each SER has been established. Future actions required to complete the MPA will be predicated on the responses by the licensees to the SERs. The licensees are being requested to respond within 30 and 90 days of the receipt of the SER from the NRC (1) to reaffirm the justification for continued operation, if required, and (2) to provide the plants for qualification or replacement of the unqualified equipment and the schedule for accomplishing the proposed corrective action.

Status Updated: 12/10/82

Multi-Plant Action No. B-62

No. of Plants: 70

Title: ESF Reset Control Design Difficiency IE Bulletin 80-06

Priority: 1

Cognizant Assistant Director: G. Lainas

Cognizant Branch Chief: J. F. Stolz

Lead Engineer: Sydney Miner

Lead Technical Review Branch ICSB

Other Review Branches:

Problem:

Certain equipment would return to its normal mode following the reset of an ESF signal. This protective action of the affected systems could be compromised once the associated actuation signal is reset.

Background:

On March 13, 1980, the Office of Inspection and Enforcement issued Bulletin 80-06, "Engineered Safety Feature (ESF) Reset Controls," to address the concern that the use of reset pushbuttons alone could permit certain engineered safety feature systems components to revert to the normal state following safety system actuation. The bulletin specified actions to be taken by licensee to address these concerns. By Task Interface Agreement, ROI 80-15, the Office of Nuclear Reactor Regulation was assigned responsibility for evaluating the licensee's responses to the Bulletin.

Current Status:

1. Acceptance Criteria
   Unless an alternative is justified by the licensee and the justification is acceptable, upon reset of ESF signals all affected equipment shall remain in its emergency mode. If there is multiple sequencing, none of the reset actions shall cause the affected equipment to deviate from its emergency mode.

2. Important Schedule Considerations
   Six licensing actions remain to be completed this year.

3. Identification and Role of the Contractors
   The detailed technical review of the licensees responses to I&E Bulletin 80-06 was performed by EG&G's Sam Ramon under DL's technical assistance contract with Lawrence Livermore National Laboratory. EG&G has completed their effort on this MPA.

Required to Complete MPA:

1. EG&G complete review and issue TER	0 actions
2. Review TER and issue SER	5 actions
3. Issue SER to licensees	6 actions

Status Updated: 12/10/82

Multiplant Action Number: B-63

Title: Emergency Procedures and Training for Station Blackout

Cognizant Assistant Director: G. Lainas

Cognizant Branch Chief: D. Vassallo

Lead Project Manager: R. A. Clark

Priority High

Technical Review Branch(es) ORB #3

Statement of Problem:

All plants are required to implement emergency procedures and training for station blackout events (loss of all onsite and offsite ac power)

Background:

ASLAB (ALAB-603) concluded that station blackout should be considered a design basis event for St. Lucie 2.

NRC staff currently assessing station blackout on a generic basis (USI A-44)

Station Blackout procedures and training determined advisable action prior to completing A-44.

Current Status:

Generic letter 81-04 sent 2-25-81 requesting all plants (except St. Lucie 1&2) implement emergency procedures and training.

All plants have indicated procedures and training will be implemented on an acceptable schedule.

Actions Required to Complete the MPA:

Letter to Rancho Seco accepting licensee's commitment on training and closing out issue.

Status Updated

December 10, 1982

Multiplant Action No. B-65

No of Plants: All BWRS (except LACBWR) - 23

Title: Safety Concerns Associated with Pipe Breaks in BWR Scram System

Cognizant Assistant Director: G. C. Lainas

Cognizant Branch Chief: D. B. Vassallo

Lead Project Manager: K. Eccleston

Priority: High

Lead Technical Review Branch: ASB

Other Review Branches: ASB, PTR, EQB, RAB, AEB, RRAB, CSB, RSB, ORB#2, ICSB, OLB, SPE

Statement of Problem:

Assess the overall risk to long-term core cooling from postulated pipe break in Scram Discharge Volume; investigate the mitigation capability for the postulated event; establish generic recommendations for correcting any deficiencies identified.

Background:

Draft NUREG-0785 issued April 3, 1981 by AEOD described certain safety concerns associated with postulated pipe breaks in the BWR Scram System. NRC letter dated April 10, 1981 to all BWR licensees requested a generic evaluation of the concerns within 45 days and a plant specific review within 120 days. The generic evaluation was submitted by GE on behalf of the BWR owners by letter dated April 30, 1981.

Current Status:

NUREG-0803 was issued to BWR licensees and applicants on 8/31/81. Plant specific licensee responses to concerns identified in this NUREG are being evaluated together with a BWROG submittal.

Action Required to Complete the MPA:

Review licensee's plant specific responses to the guidance contained in NUREG-0803 and complete review of BWROG's submittal.

Status updated: 12/10/82

Multiplant Action Number B-66

Title Natural Circulation Cooldown

Cognizant Assistant Director G. C. Lainas

Cognizant Branch Chief R. A. Clark

Lead Project Manager Ken Heitner

Priority Medium

Technical Review Branch(es) RSB (N. Lauben, M. E. Keane)

Statement of Problem:

All PWRs must review plant cooldown on natural circulation to determine if voiding will occur in the reactor vessel.

Background:

St. Lucie Unit 1, while cooling down on natural circulation due to a component cooling water malfunction, developed a steam space in the upper head of the reactor vessel.

Core cooling was not lost however complex situation deemed on undesirable challenge to the operator.

Current Status:

Generic letter 81-21, issued May 5, 1981, requested:

1. demonstration that natural circulation cooldown by procedure should not result in reactor vessel voiding

2. verification that supples of condensate grade aux feedwater are sufficient

3. aspects of training and procedures dealing with this subject

All licensees have responded

Westinghouse Owners Group Generic Report (OG-57) dated 4-20-81

Plant specific leadcase for St. Lucie is in review.

Three plants selected for 2nd quarter review are Indian Point 3, Calvert Cliffs 1&2 and Oconee 1, 2&3.

Actions Required to Complete the MPA:

Review all responses as well as Generic Westinghouse Report

44 actions remain-all scheduled for FY83

Status Updated:

December 13, 1982

FORMAT FOR MPA STATUS SHEETS

Multiplant Action Number B-67

Title Pressurized Thermal Shock to Reactor Pressure Vessels

Lead Project Manager Guy S. Vissing

Priority 1

Technical Review Branch(es) ORAB, MTEB, RSB, CPB, PTRB, GIB, RRAB

Statement of Problem:
Concerns a possibility that in PWRs pressure vessels could be subjected to severe overcooling transients followed by repressurization which could threaten the integrity of the RPVs.

Background: Pressure vessel thermal shock has been considered for many years in the context of assuring integrity in the vessel when subjected to cold emergency core cooling water during a large LOCA. Based on fracture mechanics analyses verified by enforcements, it was concluded that a postulated flow would not propagate through the vessel wall during a large LOCA. As a result of operating experience it was subsequently recognized that there could be transients in PWRs in which the vessel could be subjected to severe overcooling (thermal shock) followed by repressurization. In these pressurized thermal shock (PTS) transients, vessels could be subjected to pressure stresses superimposed upon the thermal stresses resulting from the temperature differences across the vessel wall. By letter dated April 20, 1981, we requested the PWR Owners Groups to address this problem and the licensees of operating PWRs to provide a response.

On the basis of our review of the PWR Owners Groups' responses and the PWR licensees' responses to our letter of April 20, 1981, and on the basis of our independent analysis, we determined that all operating plants could survive a severe overcooling event for at least another year of full power operation. However, for plants where neutron irradiation has significantly reduced the fracture toughness of the reactor pressure vessels (RPV), we decided that action should be taken to resolve the long term problems. Accordingly, under 10 CFR 50.54(f), by letter dated August 21, 1981 we requested from licensees of eight plants (based on the reference temperatures of the RPV and system characteristics), information concerning the issue of PTS to RPV. Specifically we requested within 60 days information related to: (1) the Reference Temperature for Nil Ductility Transition (RT_{NDT}) for the RPV and (2) operator action to prevent pressurized thermal shock and ensure vessel integrity. Also, we requested within 150 days information which would define actions and schedules for resolution of the PTS issue and analyses to support continued operation.

The eight plants selected were: Fort Calhoun, Robinson 2, San Onofre 1, Maine Yankee, Oconee 1, Turkey Point 4, Calvert Cliffs 1 and Three Mile Island 1.

By Commission Paper SECY 81-687 dated December 8, 1981, PTS was designated as an Unresolved Safety Issue. However, at the Commission briefing of November 24, 1981, we committed to having a staff position by Summer 1982 and by memorandum dated November 24, 1981 (Harold Denton to D. Eisenhut and S. Hanauer) Harold Denton directed that for those plants of immediate concern DL should manage the development of a short term resolution which can meet the scheduled committed to the Commission (Summer 1982).

Current Status:
The "60 day" and 150 day responses have been received for all plants except TMI-1. GPU will be submitting their 150 day response by the end of June 1982. The responses are under review in addition to supplemental information provided as a result of the Staff's meeting with industry representatives of June 9, 1982. A staff position is being formulated and a staff report to the Commission is being prepared.

Action Required to Complete MPA:
Our input is being prepared with appendices which will address evaluation and recommendation for each plant. The distribution of the report and the type of action which will follow will evolve after the staff's presentation to the Commission.

Multiplant Action No.: B-69

Title: PWR Main Steam Line Break with Continued Feedwater Addition

Priority: High (IE Bulletin 80-04)

Cognizant Assistant Director: G. Lainas

Cognizant Branch Chief: R. A. Clark

Lead Project Manager: Ed Tourigny

Lead Technical Review Branch: CSB/DSI

Other Review Branches: RSB, ICSB/DSI

Problem:

A licensee submitted a report to NRC identifying a deficiency in the original main steam line break (MSLB) analysis for their plant. They determined that, if the auxiliary feedwater system continued to supply feedwater at runout conditions to the affected steam generator, containment design pressure would be exceeded in about 10 minutes. The long term effect of the water supplied by the auxiliary feedwater system also had not been considered in prior analyses.

Background:

Virginia Electric and Power Company (VEPCO) submitted a report to the Nuclear Regulatory Commission (NRC) dated September 7, 1979 identifying a deficiency in the original main steam line break (MSLB) analysis for North Anna Power Station, Units 3 and 4. Stone and Webster Engineering Corporation re-analyzed the containment pressure response following a MSLB and determined that, if the auxiliary feedwater system continued to supply feedwater at runout conditions to the affected steam generator, containment design pressure would be exceeded in about 10 minutes. The long term effect of the water supplied by the auxiliary feedwater system had not been considered in prior analyses.

On October 1, 1971, IE Information Notice No. 79-24 was sent to all holders of operating licenses and construction permits, informing them of VEPCO's finding. The Consumer Power Company of Michigan (Palisades, Unit 1 facility) conducted an accident analysis review pursuant to the Information Notice and found that with offsite power available, the condensate pumps would feed the affected steam generator at an excessive rate. This was not considered in their analysis of the MSLB accident.

Because of the deficiencies that were identified in the original MSLB analyses, IE Bulletin No. 80-04 was issued on February 8, 1980. The IE Bulletin requested licensees and certain applicants of PWR facilities to assess the effect of continued feedwater or condensate addition on the containment response and reactor core reactivity response to a MSLB accident. The IE Bulletin was sent to all licensed PWR facilities and to those PWR facilities nearing licensing (Diablo Canyon, McGuire, North Anna 2, Salem 2, and Sequoyah).

Current Status:

As of May 1, 1981, 46 PWR licensees have responded to IE Bulletin 80-04. On August 17, 1981, Franklin Research Center was authorized to begin work reviewing the responses to IE Bulletin 80-04. As of April 16, 1982, Franklin Research Center concluded that some licensee submittals did not provide adequate information for them to complete their review; licensees are being requested to provide the additional information. As of 11/4/82 thirty-two reviews and their associated licensing actions were completed. This assignment is expected to be completed by the contractor by December 31, 1982.

Action(s) Required to Complete the Licensing Action:

1) Review licensees' responses to IE Bulletin 80-04.
2) Evaluate licensees' responses.
3) Evaluate licensees' corrective actions.
4) Issue Safety Evaluation Report on licensees' responses and corrective tions.

Updated: 12/7/82

Multiplant Action No.: C-01

Title: PWR Secondary Water Chemistry

Cognizant Assistant Director: G. Lainas

Cognizant Branch Chief: S. Varga

Lead Project Manager: M. Grotenhuis

Priority: 2

Technical Review Branch(es): ChEB

Statement of Problem:

PWR facilities only are affected. The NRC staff's testimony at the January 1976 Prairie Island public hearings on steam generator tube integrity set forth the regulatory position regarding secondary water chemistry monitoring requirements. The NRC position is that monitoring requirements are needed to assure control of harmful impurity buildup in the steam generator that could cause tube corrosion and impair tube integrity.

Background:

Letters were sent to PWRs requesting Technical Specifications changes to incorporate Secondary Water Chemistry monitoring requirements; a number of licensees objected to this approach on the basis of potential limitations to plant operating flexibility. NRC changed its position and requested a license condition that requires the implementation of a secondary water chemistry monitoring and control program containing appropritae procedures and administrative controls.

Current Status:

Five plants remain to be closed out. Many facilities were resolved by ORPM's owing to a lack of Technical Review priority in the post TMI period. Recent scheduling of tasks inside the NRC has made Technical Review capacity again available enabling planning for a relatively early completion.

A contractor is now involved; this is Brookhaven National Laboratories. All actions are scheduled for completion this fiscal year.

Action(s) Required to Complete the MPA:

These requests have been sent to the five licensees. Three responses are under review and we are awaiting the responses from the other two.

Status Updated: 12/07/82

Multiplant Action Number C-04

Title ESF Filter Tech. Specs.

Cognizant Assistant Director F. Miraglia

Cognizant Branch Chief D. Crutchfield

Lead Project Manager J. Lombardo

PRIORITY 3

Technical Review Branch (es) ETSB

Statement of Problem:

Some licensee have not submitted T. S. Regarding ESF filters which comply with the position of RG 1.52

Background:

Letters sent out in 1976-1977 to all licensees. Most have been completed.

Current Status:

3 *plants are outstanding. All T. S. to be issued by 12/82.

Actions Required to Complete the MPA:

Awaiting Submittal. Project Managers are pursuing

*Surry 1/2, Palisades

Status Updated 12/13/82

Multiplant Action Number: C-06 - INACTIVE

Title: Pump Support - Lamellar Tearing

Cognizant Assistant Director: F. Miraglia

Cognizant Branch Chief: D. Crutchfield

Lead Project Manager: R. Emch

Priority: 2

Technical Review Branch: GIB

Statement of Problem:

The potential for low fracture toughness and lamellar tearing on steam generators (including vessel, pressurizer and torus supports) exists due to variability in fracture toughness and resistance to corrosion of support materials.

Background:

Was unresolved safety issue A-12. At one time, NRC had a contract with FRC to review 6 plants under this issue. Review was never done because NUREG-0577 (criteria document) was not published.

Current Status:

1. GIB/DST (Dick Johnson) has responsibility for these issues.
2. NRC action on issue of lamellar tearing has been deferred until EPRI studies (which are just starting) are completed.
3. Issue of low fracture toughness will be addressed in NUREG-0577. NUREG-0577 is going to CRGR for review and will not be published in final form until mid-1983.
4. In early 1982, C-06 was declared inactive. DL concluded that this issue was not ready for implementation at operating reactors since NUREG-0577 was not published in final form.

Actions Required to Complete the MPA:

Completion of NUREG-0577 is first step. Further steps to be determined based on guidance in NUREG. This MPA is in an inactive status.

Status Updated: December 8, 1982

Multiplant Action Number: C-07

Title: Fuel Handling Accident Inside Containment

Cognizant Assistant Director: F. Miraglia

Cognizant Branch Chief: D. Crutchfield

Lead Project Manager: J. Lombardo

Priority: 2

Technical Review Branch(es): ____________

Statement of Problem:

By letter dated January 3, 1977 to Commissioner Gilinsky, Mr. Robert Pollard recommended that NRR review the potential consequences of a postulated fuel handling accident at each operating plant because this accident had not been considered during licensing of the plants.

Background:

Letters were sent to licensees of 39 operating plants in January 1977 requesting that they provide a detailed evaluation of the potential consequences of this accident. Letters were not sent to licensees of 24 operating plants because this accident had been evaluated in their SER.

Current Status:

There are 4* plants which are not complete. The issues range from concerns regarding X/Q to acceptability of filers.

Action Required to Complete the MPA:

The project managers are pursuing resolution of the remaining issues.

*Surry 1/2, Maine Yankee, Indian Point 2

Status Updated: 12/13/82

Multi-Plant Action No. C-10

No. of Plants: 54

Title: Control of Heavy Loads at Nuclear Power Plants

Priority: Phase I, High; Phase II, Medium

Cognizant Assistant Director: Gus Lainas

Cognizant Branch Chief: S. Varga

Lead Engineer: Glode Requa

Lead Technical Review Branch: Auxiliary Systems Branch

Other Review Branches: None

Problem: Dropped Heavy Loads may impact spent fuel, fuel in the core, or equipment that may be required to achieve safe shutdown and continued decay heat removal for PWRs and BWRs. If sufficient spent fuel or fuel in the core were damaged and if the fuel is highly radioactive, the potential releases of radioactive material could result in off-site doses that exceed 10 CFR Part 100 limits.

Background: USI - Task A-36 was established to examine staff licensing criteria, the adequacy of measures in effect at operating plants, and to recommend necessary changes to assure the safe handling of Heavy Loads. NUREG-0612 provides the results of the review and includes the task groups recommendation.

Current Status:

1. NUREG-0612 was issued to all licensees by letter dated December 22, 1980. The letter requested: interim actions to be completed in 90 days, a Phase I Action (report, confirmation and justification) in six months and Phase II (specific requirements) in nine months.

2. The criteria contained in NUREG-0612 is used for the acceptance criteria. The contractor is Franklin Research Center (FRC). FRC provides the TER's to the lead technical group ASB. Schedules were established to provide 59 TER's to DL for FY82 from the contractor for Phase I only.

3. Initial responses from the licensees have been very slow partially because detailed information required necessitated archival searches by previous lifting equipment suppliers and outdated equipment standards had to be compared with current standards for possible equipment upgrading as well as the complexity of information required was more than expected.

4. Draft TER's (requests for additional information) have been sent to all licensees except Kewaunee. Kewaunee has not yet satisfactorily responded to Phase I. Kewaunee's response has been rescheduled to 12/17/82 for Phase I and 12/15/82 for Phase II.

5. The licensee's have been slow in providing their initial responses and additional information on open items which has delayed the originally scheduled 59 TER's to DL in FY82.

6. The lead Project Manager has issued guidance and requested certain actions to be taken in memoranda dated January 15, 1982, April 26, 1982, and October 22, 1982, to all ORB Chiefs.

Actions Required to Complete C-10 Licensing Actions:

1. Project Managers expedite licensees for information necessary to close out open items as discussed in the April 26 and October 22, 1982 memoranda to all ORB Chiefs.

2. Contractor/ASB review open item submittals, prepare and issue final TER to DL:
   18 TERs FY83 53 TERs FY84

Status Updated: 12/13/82

Multiplant Action Number: C-11

Title: Reactor Protection System (RPS) Power Supplies

Cognizant Assistant Director: G. Lainas

Cognizant Branch Chief: J. Stolz

Lead Project Manager: J. Van Vliet

Priority:

Technical Review Branch: PSB

Statement of Problem:

Design deficiencies have been identified inthe BWR RPS MG set regulators that could adversely affect the operability of the RPS if (1) a sequence of undetected single component failures were to occur or (2) a seismic event occurred that resulted in the postulated component malfunctions.

Background:

The design deficiency was first identified during the Hatch 2 licensing process. By letter dated August 7, 1978 the other BWRs were directed to review their designs and submit a report. That letter also directed that a surveillance program be implemented. By letter dated September 24, 1980 the licensees were requested to: (1) commit to installing a Class IE system, (2) provide a schedule for completion of the modification, and (3) provide a schedule for submitting design information and proposed Technical Specifications. All licensees responded satisfactorily.

Current Status

LLNL is writing TERs based on licensee submittals. PSB is writing SERs. Six reviews have been completed. Six installations are complete. All licensees except Browns Ferry are proposing modification installation prior to the end of 1983. Browns Ferry proposes an integrated schedule with modification installation in late 1984. No unresolved technical issues exist for this item.

Actions Required to Complete the MPA:

1. Review licensee's designs (post-implementation)
2. Review licensee's proposed TS changes
3. Issue license amendment that revises TS

Status Updated: 12/12/82

Multi-plant Action Number: C-14

Title: SEISMIC QUALIFICATION OF AUXILIARY FEEDWATER SYSTEMS

Lead Project Manager: J.T. Beard

Priority: 1

Technical Review Branch(es): ORAB
ASB

Statement of Problem

Since TMI-2, great attention has been focused on the ability of PWR's to reliably provide for shutdown decay heat removal at normal system pressure. The steam generator is the preferred and proven choice for accomplishing a safe shutdown of the plant. Therefore, the auxiliary feedwater systems (AFW) should satisfy the seismic design criteria for the Safe Shutdown Earthquake (SSE), consistent with other safety-related systems in the plant. However, only those facilities licensed recently have been reviewed against the NRC Standard Review Plan which treats the AFW as an Engineered Safety Feature.

Background

In August 1980, the NRC completed a preliminary study of the risk of a seismically induced loss of decay heat removal for plants without a seismically qualified AFW. One of the conclusions was that the increase in risk during the next three years is sufficiently small to allow plant operations to continue. Another conclusion was that plants should be surveyed to confirm the extent of the PWR plants without seismically qualified AFW.

In February 1981, the NRC developed and embarked on Multi-plant Action Plan C-14, "Seismic Qualification of Auxiliary Feedwater Systems." An objective to this plan is to increase, to the extent practicable, the capability of those plants without seismically qualified AFW to withstand earthquakes up to H. Denton dated February 20, 1981. Generic Letter 81-14 requested licensees: (1) to identify, via a walkdown of the AFW system, deficiencies ammenable to simple remedial actions, and (2) to review the plants to determine the extent and areas where significant improvements may be needed. The NRC will then take action to require licensees to make improvements such as re-analysis and/or modifications, for those plants which cannot demonstrate reasonable assurance of the functioning of the AFW system following an earthquake of SSE magnitude.

Current Status

In a Generic Letter (GL 81-14), dated February 10, 1981, the NRC requested under 10 CFR 50.54(f) that all operating PWR licensees complete AFW walkdowns and report information regarding the seismic capability of AFW. This action implemented the first phase of the C-14 program.

Lawrence Livermore National Laboratory under technical assistance contract FIN A-0429 is reviewing and evaluating the licensees' responses to GL 81-14. Of the 47 PWRs involved with this MPA, LLNL has found it necessary so far to generate Requests for Additional Information for over 40 plants, in order to correct deficiencies in licensees' responses or to obtain technical clarification of the licensees' responses.

In FY81, 2 TACS were completed. In FY82, 20 TACS were completed.

Actions Required to Complete the MPA

Twenty-five plant TACS remain active. LLNL is reviewing licensees' responses to Requests for Additional Information. The objective is to verify that AFW system walk downs were conducted and deficiencies identified, to report the level of seismic qualification of each area of the AFW, and to identify plants for which significant re-analysis and/or modifications may be needed. The results of this evaluation are to be reported both on a per plant basis and in a summary form for all the plants involved.

It is anticipated that LLNL can complete the plant-specific evaluations by 10/30/82 and the project summary report during the second quarter of FY83.

Status Update

9/30/82

Multiplant Action No.: D-01

No. of Plants: 22

Title: Mark I Containment Program

Priority: 1

Cognizant Assistant Director: G. Lainas

Cognizant Branch Chief: D. Vassallo

Lead Engineer: B. Siegel

Lead Technical Review Branch: CSB-Load Audit Review
MEB-Structural Audit Review

Other Review Branches: RSB, RRAB, ICSB

Problem:

Since the original design of the Mark I containment system additional loading conditions resulting from the dynamic effects of drywell air and steam being rapidly furled into the suppression pool during a postulated LOC and from suppression pool response to SRV operation generally associated plant transient operating conditions have been identified, the objective of this program is to restore the originally intended design safety margins for each Mark I containment system.

Background:

A Mark I Owners Group (OG) with GE the lead technical organization was formed to quantify the dyrodynamic loads and assess the effects of these loads on the Mark I containment structure. The OG divided this task into a short term (STP) and long term program (LTP).

The objectives of the STP were to verify that each Mark I containment system would maintain its integrity and functional capapability when subjected to the most probable loads induced by a postulated design-basis LOCA, and to verify that licensed Mark I BWR facilities would continue to operate safety, without endangering the health and safety of the public, while a methodical, comprehensive LTP was being conducted. The staff in the "Mark I Containment Short-Term Program Safety Evaluation Report," NUREG-0408 concluded that sufficient margin of safety had been demonstrated to assure the functional performance of the containment system and, therefore, any undue risk to the health and safety of the public was precluded.

The objectives of the LTP were to establish design-basis loads that are appropriate for the anticipated life of each Mark I BWR facility (40 years), and to restore the originally intended design-safety margins for each Mark I containment system. The principle thrust of this program has been the development of generic methods for the definition of suppression pool hydrodynamic loading events and the associated structural assessment techniques for the Mark I configuration. The generic anslysis techniques are intended to be

used to perform a plant-unique analysis (PUA) for each Mark I facility. The staff in the "Mark I Containment Long-Term Program Safety Evaluation Report," NUREG-0661 concluded that the load definition procedures utilized by the BWR Owner Group, as modidied by the staff's requirements provide conservative estimates of these loading conditions and that the structural acceptance criteria are consistent with the requirements of the applicable codes and standards.

Current Status:

The licensees are in the process of performing PUA and designing and installing modifications to meet the Commission's Order date for each operating plant. Based on the staff's review of the Mark I Owners Group June 29, 1981 submittal the staff prepared a Commission Paper (SECY-81-678) requesting Commission approval for extension of the exemptions and completion dates for plant modifications needed to comply with the staff's acceptance criteria contained in Appendix A to NUREG-0661. Commission approval was received on January 8, 1982 Orders extending the exemptions and completion dates were sent out to 21 of the 22 operating reactors (Cooper Nuclear Station will meet the existing Order date and therefore did not require an extension). The licensees are in the process of preparing plant-unique analysis for staff review. Plant unique analyses reports have been received from three of the fifteen licensees. Technical assistance contracts have been awarded to Franklin Research Center and Brookhaven National Laboratory to perform an audit review of the licensee's PUA. Lead technical review responsibility for the BNL load audit review has been transfered to CSB.

Actions Required to Complete the Licensing Action:

1) Submittal of the PUA to the NRC
2) Post implementation audit of PUA by Franklin Institute and BNL on Technical Assistance Contracts
3) Issuance of SER to each licensee on acceptability of Mark I LTP modifications and analyses for their plant.
4) Technical Specification changes resulting from Mark I Modifications

Status Updated: 12/07/82

Multiplant Action Number: D-04

Title: PWR Reactor Vessel Cavity Seal Ring Missile Potential

Cognizant Assistant Director: G. Lainas

Cognizant Branch Chief: R. Clark

Priority: 2

Techncial Review Branch(es): ORB #3

Statement of Problem:

The reactor vessel cavity seal ring can become a missile if left in place during operation should a LOCA occur in or near the reactor vessel cavity.

Background:

Trojan disclosed this as a possible problem via an LER. On 2/2/78, letters were sent to all PWR licensees requesting a solution by either (a) removing the seal ring during operation or (b) confirming by analysis that the seal ring can withstand blowdown forces.

Current Status:

38 plants-completed.

4 plants-remain to be completed:

Haddam Neck

San Onofre 1

Surry 1

Surry 2

The remaining 4 plants have submitted "leak-before-break" analyses in response to MPA D-10, "Asymmetric LOCA Loads." It is expected that NRC will accept this analysis. If so, this will also solve D-4 for these plants, since the seal ring will not become a missile under "leak" conditions.

Actions Required to Complete the MPA:

The resolution of the 4 remaining plants (identified above) is dependent on the resolution of D-10 as described above.

Status Updated: 12/07/82

Multiplant Action No.: D-05

Title: Plant UPI Model Problem

Cognizant Assistant Director: G. Lainas

Cognizant Branch Chief: S. Varga

Lead Project Manager: M. Grotenhuis

Priority: 3

Technical Review Branch: RSB

Statement of Problem:

Only 2 loop PWR's are affected. All Westinghouse (W) 2 loop plants have a Low Pressure Safety Injection System (LPSI) which injects water directly into the Upper Plenum of the Reactor Vessel (UPI). This is used to counter the consequences of a single failure for 2 loop units.

However, the currently approved ECCS evaluation models for two loop plants are based on an ECCS system in which LPSI is directly to the cold leg of the Reactor Coolant System and because of this may be considered as not meeting the requirements of 10 CFR Appendix K Section II.5.

Background:

This has been an outstanding issue for two loop plants since the implementation of Regulations for an approved ECCS system. The issue became a MPA during late 1977 and 1978 when an "interim" model was developed to review the potential effect of UPI against the conventional model.

Current Status:

Six facilities are affected. W 2 loop UPI plants are presently operating on the bases of a number of approaches being taken to determine allowable peaking coefficients in an interim manner.

Acceptable long term resolution involves development of satisfactory generic models with plant specific application. Both W and Exxon fuels are involved.

A contractor has been assigned to the review of proposed models to develop acceptable generic resolutions.

Plant specific reviews are proposed for fiscal year 1983.

Action(s) Required to Complete the MPA:

Generic models must be reviewed and approved for Westinghouse and Exxon.

Plant specific models must be approved for the six facilities

Status Updated:

Multiplant Action Number: D-10

Title: Asymmetric LOCA Loads on Primary Reactor Coolant System

Cognizant Assistant Director: F. Miraglia

Cognizant Branch Chief: D. Crutchfield

Lead Project Manager: J. Shea

Priority: Medium

Technical Review Branch(es): MEB, MTEB, CPB, CSB

Statement of Problem:

Asymmetric loads resulting from rupture of the primary piping could potentially damage reactor vessel support internals and other primary system components. Damage to the reactor internals could impair core coolability.

Background:

In January 1978, all pressurized water reactor (PWR) licensees were required by the NRC to provide an assessment of the adequacy of their reactor vessel supports and other affected structures to withstand combinations of responses to asymmetric loss-of-coolant accident (LOCA) loads and the Safe Shutdown Earthquake (SSE). This potential safety problem was subsequently identified as an unresolved safety issue Task Action Plan A-2.

Current Status:

All PWR plant assessments for asymmetric loads have been received and are currently being evaluated by staff and contractor EG&G. As a basis for this evaluation, staff is implementing criteria developed as a part of the Task Action Plan A-2. These criteria are included in NUREG-0609. Concurrently some PWR licensees have performed a study of "leak before break". Staff approval of the "leak before break" concept requires CRGR review as a precondition. Plans for CRGR review are being formulated.

Action Required to Complete the Licensing Action:

Complete evaluation of Owners Group submittals including Westinghouse Owners Group proposed "leak before break" concept and plant specific submittals and issue SER.

Status Updated: 12/13/82

Multiplant Action Number: D-12

Title: BWR Non Jet Pump Core Spray Performance

Cognizant Assistant Director: G. Lainas

Cognizant Branch Chief: S. Varga

Lead Project Manager: P. J. Polk

Priority: 3

Technical Review Branch: ORAB

Statement of Problem:

Core Spray System nozzle coverage differs in a steam environment vis-a-vis an atmospheric environment. The original design is based on atmospheric analyses and tests. The generic issue requires that nozzle coverage be reanalyzed to reflect the steam environment.

Background:

History is inappropriate since only one plant remains outstanding.

Current Status:

All non-Jet Pump BWRs have either made the necessary modifications or committed to same with the exception of Nine Mile Point.

ORAB is presently reviewing the Nine Mile Point submittal in which the licensees concludes that modification of spray nozzles is not required.

Action Required to Complete the MPA:

The Oyster Creek and Nine Mile submittals are currently under review.

Status Updated: 12/07/82

Multi-Plant Action No. D-15

No. of Plants: 70

Title: High Energy Line Break and Consequential System Failure

Priority: 3

Cognizant Assistant Director: G. Lainas

Cognizant Branch Chief: S. A. Varga

Lead Engineer: M. Grotenhuis

Lead Technical Review Branch EQB, RRAB, GIB

Other Review Branches:

Problem: Certain non-safety grade equipment, if subjected to an adverse environment, could impact the safety analyses and the adequacy of the protective functions performed by safety grade equipment. The NRC is concerned that a potential may exist at operating light water reactor facilities, for an unreviewed safety matter related to the effects of the environment on control systems resulting from high energy line breaks inside or outside containment and the results of these effects on the required safety systems.

Background:
On September 17, 1979, the NRC requested that all LWR licensees review their plants to determine whether control system failures caused by high energy line breaks (HELB) could result in consequences more severe than previously analyzed for the HELB. All licensees responded in a timely manner (20 days). A status reported from D. G. Eisenhut to H. Denton dated October 15, 1979 provided a basis for continuing operation. A meeting with representatives of the nuclear industry was held on November 9, 1979. A status report P. S. Check to D. G. Eisenhut dated December 19, 1979 stated that the NRC task group had found no specific identified safety problems. There were remaining concerns which fall within the scope of NUREG-0660 II.C.3.

Current Status:

All TAC's issued on this subject are still open. A memo has been prepared which includes instructions to PM's to close the issue and sent a letter to each utility informing them that any continuing effort by the staff will be under NUREG-0660 II.C.3.

Actions Required to Complete the MPA:

D. Eisenhut has received the above memo and has requested a meeting with R. Mattson and S. Hanauer on the matter. Following this each PM would receive the above instructions.

Status Updated: 12/07/82

Multiplant Action No.: D-17

Title: Definition of Operable

Lead Project Manager: Sydney Miner

Priority Medium

Technical Review Branch(es): None

Statement of Problem:

Clarification of the term "OPERABLE" as it applies to support system outages or multiple outages of redundant components.

Background:

In a letter dated April 10, 1980, an explanation of the problem plus accompanying illustrate examples of recommended changes contained in the associated bases, were delineated to all licensees. The licensees were required to submit proposed changes to tech specs applicable to their plant and to implement procedures designed to assure compliance with the specifications containing new requirements.

Current Status:

1. Acceptance Criteria
   The acceptance criteria that LCO should be incorporated in the Technical Specification which requires that the plants be in cold shutdown within 36 to 39 hours if redundant ECCS loops become inoperable either due to failures in redundant ECCS loops or the diesel generators.

2. Important Schedule Considerations
   Five licensing actions were completed last fiscal year. All the remainder are scheduled to be completed this year.
3. Review Responsibilities
   This MPA is being handled completely within the Project Management Organization.

Actions Required to Complete MPA:

1. Remaining Milestones

   (a) Approval of remaining changes to the Technical Specifications of the remaining plants.

   (b) Issuance of the SER and the License Amendments.

2. Plant Actions Remaining

   There are 15 remaining licensing actions.

Status Updated: 12/14/82

Multiplant Action Number: E-04

Title: BWR Single Loop Operating

Cognizant Assistant Director: G. Lainas

Cognizant Branch Chief: D. Vassallo

Priority: Low

Technical Review Branches: RSB, CPB

Statement of Problem:

The standard BWR Technical Specifications do not permit a plant with two recirculation loops to operate either with one loop or in the natural circulation mode. Fifteen operating BWRs have requested approval to operate at reduced power levels with a single loop if problems develop with a jet pumb, valve, seals, flow controller, etc., in the other loop. Most of the potential safety reviews can more appropriately be resolved on a generic basis.

Background:

Sincle loop operation at limited power levels had previously been authorized for 6 BWRs for short periods of time (one week to two months). During the fall of 1978 while Browns Ferry Unit 1 was operating on a single loop, an increase in instrument noise was noted above 60% power, which could be indicative of flow and flux variations. Based on this operating experience, the staff has concluded that BWRs can be safely operated at at least 50% power by natural circulation (i.e., without forced flow from any recirculation loop). Accordingly, as an interim measure, six plants have been authorized to operate, if necessary, at power levels of 50% with a single recirculation loop while the generic concern of flow stability at higher power levels during single loop operation are being resolved.

Current Status:

With respect to operation at power levels above 50% power, a meeting was held October 22, 1981 with all BWR licensees and GE to discuss GE's evaluation of Browns Ferry's and other BWR operating experience with single loop operation. RSB and CPB have prepared a draft list of questions which we discussed in a meeting with GE on January 21, 1982. The issues regarding operation at power levels above 50% are not likely to be resolved in FY83. In the interim, the effort is being directed approving operation at 50% power.

Actions Required to Complete the Licensing Action:

Complete SE inputs by CPB for operation at 50% power and issued revised Technical Specifications.

Status Updated: December 8, 1982

Multi-Plant Action No. E-05
No. of Plants: 3
Title: Westinghouse N-1 Loop Operation
Priority: Low
Cognizant Assistant Director: G. C. Lainas
Cognizant Branch Chief: S. Varga
Lead Engineer: D. Wigginton
Lead Technical Review Branch: RSB
Other Review Branches: ICSB

Problem:

All Westinghouse plants have a provision in their license that prohibits operation with less than all loops (N) in service.

Background:

It may be desirable to operate plants with one loop out of service. Present restrictions in the license do not permit this type of operation.

Current Status:

Only three Westinghouse plants, Beaver Valley and Zion (1 and 2), have submitted proposed amendments for N-1 loop operation. Beaver Valley is lead plant and most of the review has been completed. Trojan, a plant without loop isolation valves, has expressed an interest in submitting an application.

Action(s) Required to Complete the Licensing Action:

NRC to review contractor (Franklin Inst., Lawrence Livermore) inputs and write SER on Beaver Valley. Zion review to follow. Other Westinghouse pLants will probably submit similar applications if Beaver Valley is approved.
